

Quick Reference Guide

Digital Authentication Framework

Welcome to the Visa Digital Authentication Framework (DAF). This framework outlines an expanded set of capabilities and requirements to help enable merchants to deliver frictionless shopping experiences while addressing effective fraud management for eCommerce transactions.

Under the framework, Visa is expanding the criteria for fully authenticated digital transactions and the associated fraud dispute rules. The Digital Authentication Framework outlines an approach for a consistent and verifiable set of transaction data that can help increase issuer confidence and facilitate risk decisions that can ultimately lead to increased approval rates and lower fraud. Merchants that meet the program criteria on qualified purchase transactions are eligible to receive fraud dispute protection.

Merchants, token requestors, acquirers, and issuers can participate in the Digital Authentication Framework (DAF) via:

- **Visa Token Service (VTS)** provides a mechanism for Token Requestors (TRs) to enable CNP tokens to be issuer authenticated and receive fraud dispute protection.
- **EMV 3-D Secure (EMV 3DS)** provides the mechanism for a merchant to provide contextual data to an issuer to enable a cardholder to be authenticated with significantly less friction by sharing additional data elements with the cardholder's issuing bank.

This document is a quick reference guide for you to get started using the Digital Authentication Framework (DAF).

Merchants, Token Requestors (TRs), 3DS Service Providers and Acquirers

If you are a merchant, token requestor (TR), or 3DS server provider and want to use DAF, this is the place to start. See below for reference documentation on how to implement the Digital Authentication Framework (DAF) either via VTS or EMV 3DS.

Visa Token Service (VTS) with DAF

Implementation Guides

Contact your Visa Representative for implementation guides and API specifications.

Additional Considerations for Europe

In accordance with Visa Rule ID# 0030762, the Visa digital authentication framework applies to qualifying domestic transactions, intraregional transactions, and interregional transactions, as follows:

Table 0-2: Visa Digital Authentication Framework Participation:

Issuer Location	Merchant Location
Europe Region	Europe Region

Effective 23 April 2022, an acquirer or Token requestor may only submit a transaction under the Visa Digital Authentication Framework if either:

- Strong customer authentication has been completed under either of the following:
 - The Visa Delegated Authentication Program (VDAP)
 - An agreement in force with issuers for strong customer authentication delegation
- The Transaction is eligible for an acquirer strong customer authentication exemption.

EMV 3-D Secure (EMV 3DS) with DAF

Here are the high-level requirements for merchant participation in the DAF EMV 3DS program. These requirements are explained in detail in the Visa Digital Authentication Framework 3-D Secure Implementation Guide for Merchants/Acquirers.

- Contact your acquirer to enroll in EMV 3DS DAF participation and obtain a Visa Merchant Identifier (VMID). Share the VMID with your 3DS Server provider to be used in the authentication request. Note, an additional registration process will be required for merchant accepting transactions in Europe.
- Support EMV 3DS 2.1 or higher
- 3DS Server (3DSS) needs to support the DAF EMV 3DS message extension in the authentication layer¹, enable additional required data elements, and consume new issuer DAF participating indicator in the PRes message
- Support challenge functionality for Authenticated Payment Credential set-up
- Complete Visa Secure Test Suite test cases for DAF (future requirement)
- Activate 3DSS DAF functionality in production environment
- Monitor program performance

Note: Europe Merchant Region

In Europe where PSD2 SCA applies to a transaction, a merchant/TR can only submit a transaction (domestic/intra-regional) under the DAF program if:

- Strong customer authentication has been completed under either of the following:
 - The Visa Delegated Authentication Program (VDAP)
 - An agreement in force with Issuers for strong customer authentication delegation
- The transaction is eligible for an Acquirer strong customer authentication exemption.

Implementation Guides

Testing

Merchants and 3DS Server Providers will need to complete certification testing with Visa to confirm that they support the DAF EMV 3DS extension and related use cases. More details on testing will be published in an updated checklist and implementation guide.

¹ See Appendix B in the *Visa DAF 3DS Implementation Guide for Merchants/Acquirers* for details on the *Visa EMV 3DS DAF Extension*

Card Issuers

If you are a card issuer, you will need to make updates to your authentication and authorization processing platforms to support DAF. See below for the key changes DAF brings, both from a VTS and EMV 3DS perspective.

Visa Token Service (VTS) with DAF

Summary

The following are DAF high-level requirements for authorization processing for Issuers:

- Issuers are reminded to comply with the Cloud Token Framework mandate effective Oct 2020.
- Issuers will receive enhanced token data in TLV Field 123 and TLV Field 125 in authorization and purchase messages that are authenticated by the Visa Digital Authentication Framework.
- Issuers will receive the DAF indicator in F34 Tag C0—Authentication Program for a VISA DAF qualified transaction.
- Issuers that are activated to receive Field 60.8 or Field 63.6 must support receiving the ECI values of 05 and 5, respectively, in e-commerce authorization messages when no CAVV is present in the message.

Implementation Guides

Detailed information regarding the DAF program can be found in [Visa Token Service Implementation Guide for Issuer/I-TSP Participation in VDEP Solutions](#)

EMV 3-D Secure (EMV 3DS with DAF)

Summary

Here are the high-level requirements for card issuer participation in the DAF EMV 3DS program. These requirements are explained in detail in the Visa Digital Authentication Framework 3-D Secure Implementation Guide for Issuers.

- Support EMV 3DS 2.1 or higher
- Support CAVV usage 3, version 7 and DAF indicator in CAVV
- Consume Authorization Request Field 34 (Electronic Commerce Data)
- Update authorization logic to recognize DAF transactions
- Access Control Server (ACS) needs to support the DAF message extension in the authentication layer, update ACS logic to incorporate DAF extension and risk advice
- Support challenge functionality for Authenticated Payment Credential set-up
- Activate ACS DAF functionality in production environment
- Enroll issuer BINs for DAF EMV 3DS Participation prior to 15 April 2023 DAF EMV 3DS activation date.
- Issuer participation in DAF is available from 23 April 2022 and will be required after 15 April 2023

Testing

Access Control Server (ACS) providers will need to complete certification testing with Visa to confirm they support the DAF EMV 3DS extension and related use cases. More details on testing will be published in an updated checklist and implementation guides.
