## Authorization Processing Integrity Acquirer Detail Report (AB605010-AA and AB605010-FF)

The Authorization Processing Integrity Acquirer Detail Report for acquirers enables enhanced merchant reporting of the processing integrity fees.

The report provides acquirers with detailed transaction activity for each customer ID/ICA number identifying authorizations that were assessed a processing integrity fee. Acquirers may optionally choose to receive this report. Mastercard generates the report weekly. The report is delivered each Monday at 18:30 (Central Time). Acquirers can request to receive the report by contacting Global Customer Service.

### AB605010-AA image report

The report is available via bulk file in data or image file format. The image file is also available via Mastercard Connect® Operational Reports Online Reporting.

**NOTE: There is a size restriction applicable to any operational report; therefore, if the report is likely to be large (more than 1,000,000 lines), then delivery via bulk file is required.**

Report ID: AB605010-AA: Authorization Processing Integrity Acquirer detail Report (image file format):

- Bulk ID: T852
- Mastercard Connect Operational Reports: Authorization Processing Integrity Acquirer Detail Report

**NOTE: If a subscribing acquirer has no non-compliant authorizations to report within a billing period, the image format report (AB605010-AA) is not generated.**

## Field descriptions

| Field name displayed in report | Field Name (expanded)            | Data Element (DE)    | Field Description                                                                                                                                          |
|--------------------------------|----------------------------------|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ACQUIRER ICA/CUST ID           | Acquirer Institution ID          | DE 32                | Left-justified with trailing spaces (for example, 9744).                                                                                                   |

AB605010-FF data file

Report ID: AB605010-FF: Authorization Processing Integrity Acquirer Detail Data File (data file format):

- Bulk ID: TKR8

**NOTE: If a subscribing acquirer has no non-complaint authorizations to report within a billing period, the data file format report (AB605010-FF) will be generated and include a trailer record with a record count of zero.**

- Seven TKR8 bulk files are delivered each Monday following Sunday’s weekly billing cycle. A separate file of non-compliant transactions is generated for each day (Sunday-Saturday) of the prior week containing non-compliant transactions.

Field descriptions

The format and layout of the data file follows. It is a fixed format file. All fields are delimited by ','.

Field descriptions

| Field Name                       | Start | End | Length | Data Element (DE) | Field Description                                                                                                                                         | Field Data Type |
|----------------------------------|-------|-----|--------|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|

## Transaction Processing Excellence Issuer Detail Report (AB705010-AA and AB705010-FF)

The following section describes the AB705010-AA and AB705010-FF detail reports.

### AB705010-AA image report

The report is available via bulk file in data or image file format. The image file is also available via Mastercard Connect® Operational Reports Online Reporting. Report ID AB705010-AA: Transaction Processing Excellence Issuer Detail Report (image file format):

- Bulk ID: T852
- Mastercard Connect Operational Reports: Transaction Processing Excellence Issuer Detail Report

**NOTE: There is a size restriction applicable to any operational report; therefore, if the report is likely to be large (more than 1,000,000 lines), then delivery via bulk file is required. If a subscribing issuer has no non-compliant authorizations to report within a billing period, then the image format report (AB705010-AA) is not generated.**

### Transaction Processing Excellence Issuer Detail Report AB705010-AA

The Transaction Processing Excellence Issuer Detail Report for issuers enables enhanced reporting of transaction processing excellence (TPE) fees. The report provides issuers with detailed transaction activity for each customer ID/ICA number identifying authorizations that were assessed a fee. The report is optional and Mastercard generates the report weekly. The report is delivered each Monday at 18:30 (Central Time). Issuers can request to receive the report by contacting Global Customer Service.

### AB705010-FF data file

Report ID AB705010-FF: Transaction Processing Excellence Issuer Detail Report (data file format):

- Bulk ID: T34P
- Seven T34P bulk files are delivered each Monday following Sunday's weekly billing cycle. A separate file of non-compliant transactions is generated for each day, (Sunday - Saturday) of the prior week containing non-compliant transactions.

**NOTE: If a subscribing issuer has no non-compliant authorizations to report within a billing period, the data file format report (AB705010-FF) will be generated and will include a trailer record with a record count of zero.**

### Field descriptions

The format and layout of the AB705010-FF data file is a fixed format file, all fields are delimited by ";".

## Field descriptions

The fields on the Authorization Parameter Summary Report (SI737010-AA) are listed in table format.

The Authorization Parameter Summary Report (SI737010-AA) includes:

- Header Information
- Global Parameters
- Stand-In Parameters

**NOTE: Mastercard provides an updated version of this report for customers when their parameters change.**

## Global Parameters

The Global Parameters fields on the Authorization Parameter Summary Report (SI737010-AA) are listed in table format.

The fields in the Global Parameters section may include the following data.

### Report fields

| Field                            | Description                                                                                                                                                                                                               |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Product Code                     | Three-position field that identifies the financial network code.                                                                                                                                                          |
| Cardholder Billing Currency Code | Three-digit number that identifies the participant's currency code.                                                                                                                                                       |
| CVC 2 Participant                | A one-character flag that indicates whether a customer participates in CVC 2. <ul style="list-style-type: none"><li>• Y = Customer participates in CVC 2.</li><li>• N = Customer does not participate in CVC 2.</li></ul> |

| Field                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AVS Level Participant            | <p>A one-position field that indicates a customer's AVS service level.</p> <ul style="list-style-type: none"> <li>• 0 = AVS not supported.</li> <li>• 1 = Issuer provides AVS, receives full address data.</li> <li>• 2 = Issuer provides AVS, receives condensed address data. This level supports the algorithm that uses the first five numeric digits in an address (when scanning the address from left to right).</li> <li>• 3 = Issuer provides AVS, receives condensed address data. This level supports the algorithm that uses the first five numeric digits in an address. This algorithm stops searching for numbers after it encounters an alphabetic character or space (when scanning the address from left to right).</li> <li>• 4 = Issuer provides AVS, receives condensed postal/ZIP code and address data. This level supports the algorithm that uses only numeric digits (with a maximum of nine digits) in the cardholder postal/ZIP code, and the first five numeric digits in an address (when scanning the address from left to right).</li> </ul> |
| Payment Cancellation Participant | <p>A one-character flag that indicates whether a customer participates in Payment Cancellation.</p> <ul style="list-style-type: none"> <li>• Y = Customer participates in Payment Cancellation.</li> <li>• N = Customer does not participate in Payment Cancellation.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| PAN Mapping Participant          | <p>A one-character flag that indicates whether a customer participates in the Contactless Mapping Service.</p> <ul style="list-style-type: none"> <li>• Y = Customer participates in the Contactless Mapping Service.</li> <li>• N = Customer does not participate in the Contactless Mapping Service.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Customer Service       | This phone number is not displayed.                                                                                                                                                                                                                                                        |

## Stand-In Parameters

Descriptions of the Stand-In Parameter fields in the Authorization Parameter Summary Report (SI737010-AA).

The Authorization Parameter Summary Report (SI737010-AA) Stand-In parameters include the following data.

### Report fields

| Field              | Description                                                                                                                                                                                                                                 |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Hours of Operation | Indicates the hours of operation for the issuer's authorization system.                                                                                                                                                                     |
|                    | <p>Time difference between the customer's local time and Coordinated Universal Time (UTC).</p> <p>UTC Offset represents whether the local time is ahead (+) or behind (-) UTC by the number of hours indicated in the UTC Offset field.</p> |
| D.S.T.             | Daylight Saving Time (D.S.T.) represents the daylight-saving time start and end dates and times for the customer.                                                                                                                           |

| Field                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Local Time                         | Indicates the open and close local time for the customer.                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Holidays for Call Referral Center  | Definition of 26 holidays for the issuer's Call Referral Center, with up to two openings and closings per holiday.                                                                                                                                                                                                                                                                                                                                                                                                 |
| Decision Matrix                    | <p>A matrix that contains values that represent a customer's choice of Stand-In Authorization responses to transactions if a transaction goes to Stand-In Authorization in a given state.</p> <ul style="list-style-type: none"> <li>• C = Call referral</li> <li>• N = Decline</li> <li>• A = Continue with Stand-In Authorization</li> <li>• P = Capture card</li> </ul> <p>Open Signed In, Closed Signed In</p> <p>Indicates times when the issuer's authorization center is open versus when it is closed.</p> |
| Open Signed Out, Closed Signed Out | Indicates times when the issuer's authorization center is signed in versus when it is signed out (for online issuers).                                                                                                                                                                                                                                                                                                                                                                                             |
| Card Level Support Participant     | <p>A one-character flag that indicates if the customer is a Card Level Support participant.</p> <ul style="list-style-type: none"> <li>• Y = Customer participates in Card Level Support.</li> <li>• N = Customer does not participate in Card Level Support.</li> </ul>                                                                                                                                                                                                                                           |
| Multi-Currency Limits Participant  | <p>A one-character flag that indicates if the customer participates in multi-currency limits in Stand-In Authorization.</p> <ul style="list-style-type: none"> <li>• Y = Customer participates in multi-currency limits.</li> <li>• N = Customer does not participate in multi-currency limits.</li> </ul>                                                                                                                                                                                                         |
| Stand-In PIN Retries               | Applies only to the Europe region. Indicates the number of invalid PIN attempts allowed using a value of 1-5. This parameter applies only to the Online PIN Validation in Stand-In Authorization.                                                                                                                                                                                                                                                                                                                  |

| Field                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Store-and-Forward (SAF) Controls | <p>Additional parameters by which issuers can receive their SAF messages.</p> <p>Delivery Type</p> <p>Unsolicited: Issuer receives SAF messages after signing on to the Mastercard Network using a Network Management Request/0800 message containing DE 70 (Network Management Information), value 001 (Sign-on [by BIN]) or value 061 (Group sign on [by Mastercard group sign on]).</p> <p>Number of Simultaneous Sessions</p> <p>Represents the Number of Simultaneous Advice Messages that can be processed simultaneously. There is a maximum of 10 advice messages that can be processed simultaneously. Default is 10.</p> |
| Advice Response Wait Time        | <p>Advice response wait time in seconds (20 seconds) before SAF session termination (Default is a maximum of 20 seconds).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Automatic Deletion Option        | <p>Indicates whether the Stand-In System should delete the SAF message if a response is not received from the issuer after a given number of delivery attempts. The Stand-In Authorization will attempt to resend the SAF messages until:</p> <ul style="list-style-type: none"> <li>• A response is received</li> <li>• The resend limit has been reached</li> <li>• The advice is on file for four days (Default is No)</li> </ul>                                                                                                                                                                                               |
| No Response Resend Limit         | <p>Number of times (1–20) that the Stand-In Authorization attempts to resend a SAF message without response from the issuer before auto-deleting SAF messages. If Automatic Deletion Option is selected, default is 3.</p>                                                                                                                                                                                                                                                                                                                                                                                                         |

| Field                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Transaction Processing Parameters | <p>This section may vary depending on the number of rules that apply to a customer. The report reflects all rules that apply to that particular customer.</p> <p>Target Country</p> <p>Indicates the acquirer country for which the limits are applied.</p> <p>Mastercard has established minimum and maximum values for certain parameters. Mastercard will set the minimum limits as default values to establish customer's limits.</p> <ul style="list-style-type: none"> <li>Foreign Default: Established limits outside of the country of issuance.</li> <li>Global: Established limits for all customers by product code, acceptor business code/merchant category code (MCC), and/or cardholder-activated terminal (CAT) level.</li> </ul> |
| Promo Code (Promotion Code)       | <p>Indicates the promotion code for which the limits are applied. The six-character alphanumeric codes an issuer establishes to identify transactions meeting the requirements for an issuer's promotional program on a card range.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| CAT Level                         | <p>Lists a one-character numeric code that identifies transactions that occur at a CAT. A CAT is a cardholder-activated terminal that is usually unattended and accepts payment cards, debit, charge, and proprietary cards for a card range. CATs are defined by levels.</p> <ul style="list-style-type: none"> <li>0 = Not a CAT transaction</li> <li>1 = Automated dispensing machines with PIN</li> <li>2 = Self-service terminals</li> <li>3 = Limited-amount terminals</li> <li>4 = In-flight commerce terminals</li> <li>6 = Electronic commerce</li> <li>7 = Transponder</li> </ul>                                                                                                                                                       |
| Product ID                        | <p>Lists the three-character code that identifies the type of card program for an account, such as Gold Mastercard® card.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| MCC/TCC                           | <p>Acceptor business code/merchant category code (MCC) and the transaction category code (TCC) for which limits are applied.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

|                                                           | <p>Card Not Present Amount</p> <p>Transaction amount limit when a card is not present.</p>                                                                                                                                                                                                                                                                                                                                                                                         |
| Product Graduation Limits Authorization Parameter Summary | This section of the report may vary depending on whether the account range has product graduated limits. If the account range does not have product graduated limits, this section does not display.                                                                                                                                                                                                                                                                               |
| Accumulative Limits                                       | <p>Issuer established limits for accumulated transaction counts and amounts over a specified number of days. The accumulation limits are for the number of transactions and amounts. Stand-In Authorization will not approve any amount that raises the accumulative amount already approved above the specified limit for the specified period of days.</p> <p>Currency Code</p> <p>Three-digit number that identifies the customer's chosen currency code for amount limits.</p> |
| Premium Controls                                          | <p>Indicates specific limits that Stand-In Authorization applies to accounts listed in the Account File as Premium Listings. The Premium Listings designation is a method of identifying cardholder accounts that should have higher authorization limits than standard limits for the card type.</p> <p>During the Accumulative Limits test for Premium accounts, Stand-In Authorization applies the Days and Count Limit parameters.</p>                                         |

| Field                  | Description                                                                                                                                                                                                                                                                                                                                                     |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Group and Series       | Identifies a range of card account numbers listed in the Electronic Warning Bulletin file submitted by Mastercard on behalf of an issuer to the Account Management System for the purpose of notifying a merchant to capture any card bearing an account number that falls within that range.                                                                   |
| Stand-In Blocked Range | Identifies a range of card numbers within a BIN that have not been issued to cardholders or card ranges previously blocked and should be unblocked. Range Blocking only applies for transactions processed by Stand-In. Card numbers within blocked ranges do not automatically appear in the Account Management System (AMS) Electronic Warning Bulletin file. |
| On-behalf Services     | Lists the on-behalf service description for the on-behalf services that are enabled for an account range. There is a maximum of 10 on-behalf services.                                                                                                                                                                                                          |

## MIP Transaction Blocking ICA Level Block Summary (SI738010-AA)

An overview of the MIP Transaction Blocking ICA Level Block Summary (SI738010-AA) is listed in table format.

### Report overview

## Field descriptions

The fields on the MIP Transaction Blocking ICA Level Block Summary (SI738010-AA) report are listed in table format.

### Field descriptions

| Field                       | Description                                                                                                                                                                                                                                                                                                                                                               |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Billing ICA                 | ICA that is billed for the Issuer ICA Number Transaction Blocking Service activity. This ICA may be the same or different than the Issuer ICA number.                                                                                                                                                                                                                     |
| Issuer ICA                  | Unique six-digit ID number assigned by Mastercard to identify a customer or processing endpoint. Sequenced by ICA and listed numerically. This ICA may be the same or different than the Billing ICA number.                                                                                                                                                              |
| Country Code                | A three-digit, numeric code that identifies the country. Issuers may use these codes to establish higher or lower transaction limits for a country or countries where the transaction is acquired.                                                                                                                                                                        |
| Merchant Type               | DE 18 (Merchant Type) is the classification (acceptor business code [MCC]) of the merchant's type of business or service.                                                                                                                                                                                                                                                 |
| CAT Level Code              | DE 61 (Point-of Service [POS] Data), subfield 10 (Card Activated Terminal Level [CAT]) indicates whether the cardholder activated the terminal with the use of the card and the CAT security level.                                                                                                                                                                       |
| POS Terminal PAN Entry Mode | DE 22 (Point-of-Service [POS] Entry Mode), subfield 1 (POS Terminal PAN Entry Mode) indicates how the PAN was entered at the terminal.                                                                                                                                                                                                                                    |
| Response Code               | DE 39 (Response Code) defines the disposition of a previous message, or an action taken as a result of receipt of a previous message.<br><br>Response codes also are used to indicate approval or decline of a transaction. If an authorization is declined, the response code indicates the reason for rejection and may indicate an action to be taken at the acceptor. |
| Group ID                    | Identifies a grouping of issuer account ranges that use the same transaction criteria for routing to the same destination route.                                                                                                                                                                                                                                          |

| Field                 | Description                                                                                                                                                                                                                                     |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Scope                 | <p>Indicates where the block occurs.</p> <ul style="list-style-type: none"> <li>Acquirer: Indicates that the block occurred at the acquirer MIP.</li> <li>Stand-In: Indicates that the block occurred during Stand-In Authorization.</li> </ul> |
| Associated BIN Ranges | <p>Identifies a range of card numbers within a BIN that are associated to that blocking ICA. These blocks occur at the MIP and not in Stand-In Authorization. These ranges may or may not have been issued to cardholders.</p>                  |

## Authorization Summary by CAT Level Report (SI458010-AA)

An overview of the Authorization Summary by CAT Level Report (SI458010-AA) is listed in table format.

### Report overview

|              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Purpose      | To provide customers with a tool for analyzing authorization performance for cardholder-activated transactions.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Description  | <p>Mastercard produces this report for each CAT level. The report shows authorization transaction processing volumes and percentages by BIN for the week for the CAT level of the report. It reflects network usage; that is, transactions that travel across the Mastercard Network, not only billable items, which are listed apart from other transactions in the authorization detail reports located in <i>Mastercard Consolidated Billing System</i>.</p> <p>The report displays activity by authorization response: Accept (approved), Decline (decline), Call-Me (refer to card issuer), and Pick-Up (capture card). It also displays transactions by transaction category, such as mail/telephone and retail.</p> |
| Frequency    | Weekly                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## Field descriptions

The fields on the Authorization Summary by CAT Level Report (SI458010-AA) are listed in table format.

### Field descriptions

| Field                  | Description                                                                                                                                                                                                                                                                                                                   |
|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CAT Processed Activity | Summary of all authorization activity received and processed by the issuer for the CAT level on the report, listed by the following response categories: <ul style="list-style-type: none"> <li>• Accept (approved)</li> <li>• Decline</li> <li>• Call-Me (refer to card issuer)</li> <li>• Pick-Up (capture card)</li> </ul> |
| Member Volume          | Total CAT transaction volume processed by the customer that generated the specific response and the percentage it represents of total customer CAT transaction volume.                                                                                                                                                        |
| Member YTD Volume      | Summary of the customer's CAT authorization volume for the calendar year-to-date (by response category) and the percentage it represents of total member CAT volume for the year-to-date.                                                                                                                                     |
| System Volume          | Volume of CAT authorization transactions processed by the entire membership that week and the percentage it represents of total CAT volume for the membership for the week.                                                                                                                                                   |
| System YTD Volume      | Volume of CAT authorization transactions processed by the entire membership for the calendar year-to-date and the percentage it represents of total CAT volume for the membership for the year-to-date.                                                                                                                       |
| Total Member Processed | Total member CAT volume, year-to-date volume, system volume, and system year-to-date volume for all authorization responses.                                                                                                                                                                                                  |

| Field                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Approvals by Transaction Type | <p>Summary of all approved responses returned for CAT transactions, divided by the following transaction categories:</p> <ul style="list-style-type: none"> <li>• Mail/Telephone</li> <li>• Retail</li> <li>• Cash Advance</li> <li>• College/Hospital</li> <li>• Hotel/Motel</li> <li>• Vehicle Rental</li> <li>• Transportation</li> <li>• Restaurant</li> <li>• ATM</li> <li>• Unique</li> <li>• Payment Transaction</li> </ul> |
| Average Dollars               | Average dollar amount approved for CAT transactions for the week, listed by transaction type.                                                                                                                                                                                                                                                                                                                                      |
| Total Dollars                 | Total dollar amount approved for CAT transactions for the week, listed by transaction type.                                                                                                                                                                                                                                                                                                                                        |
| Total Volume                  | Total CAT transaction volume processed by the customer for the week, listed by transaction type. In the sample, the total volume for Restaurant transactions is 3. This indicates that out of a total of 86 approved CAT 2 transactions, 3 were for Restaurant.                                                                                                                                                                    |
| YTD Average Dollars           | Average U.S. dollar amount approved, by transaction type, for CAT transactions for the calendar year-to-date. This amount is the result of dividing the YTD TOTAL DOLLARS by the YTD TOTAL VOLUME.                                                                                                                                                                                                                                 |
| YTD Total Dollars             | Total U.S. dollar amount of CAT transactions approved by the customer for the calendar year-to-date.                                                                                                                                                                                                                                                                                                                               |
| YTD Total Volume              | Total CAT transaction volume approved by the customer for the calendar year-to-date.                                                                                                                                                                                                                                                                                                                                               |
| Total Member Approvals        | Average U.S. dollar amount, total U.S. dollar amount, total transaction volume, and year-to-date totals for all CAT transactions approved by the customer.                                                                                                                                                                                                                                                                         |

## Related reports in other guides

Information concerning authorization detail reports, billing reports, and layouts of all reports related to listing accounts or merchants listed in the Merchant File are provided in other manuals.

Authorization detail reports and billing reports, including the following reports, are found in the **Pricing and Billing Resource Center** application on Mastercard Connect®.

### Related reports

| Report Name                          | Report Number |
|--------------------------------------|---------------|
| Issuer Authorization Detail Report   | AB201010-A2   |
| Acquirer Authorization Detail Report | AB202010-A1   |
| Billable Customer Summary            | GB071010-AA   |
| Customer Service Summary             | GB073010-AA   |
| Customer Service Roll-Up             | GB074010-AA   |

Refer to the [Account Management System User Manual](#) for layouts of all reports related to listing accounts in the Account Management System (AMS) or merchants listed in the Merchant File.

## BIN Table Resource File

The BIN Table Resource File is a fixed-block format with a record size of 150 bytes and a block size of 27900 bytes. The file is identified as MCI.AR.TR52.

Each file consists of the following:

- Header Record
- Detail Record for each account range
- Trailer Record

The BIN Table Resource File is sent to acquirers either as a TR52 production bulk type or as a TR54 test bulk type. Standard Mastercard Global File Transfer methods are used to distribute the BIN Table Resource File.

The BIN Table Resource File layout contains the account ranges (low range and high range) along with the associated issuing member ID (that is, ICA number) and all token account ranges in use.

### BIN Table Resource File layout

## PVV/PIN Offset File

The PVV/PIN Offset File has a fixed length of 64 characters.

Each file consists of the following:

- Header record
- Detail records
- Trailer record

Issuers sending their files to the Dual Message Authorization System can use Bulk ID RA85 or CONNECT:Direct to send the PVV/PIN Offset file to Mastercard.

Issuers sending their files to the Single Message System can use Bulk ID RM29 (Production), RM31 (MTF), or CONNECT:Direct to send the PVV/PIN Offset file to Mastercard.

| PAN                  | Alphanumeric | 19     | With trailing spaces                                                                                                                                                              |
| Card expiry date     | Numeric      | 4      | YYMM (must contain a valid year and month)                                                                                                                                        |
| Card sequence number | Numeric      | 1      | Must contain the sequence number associated with the PAN or 0. A value of 0 indicates that the card sequence number should not be used as criteria when matching to the PVV file. |
| PVV/PIN Offset       | Numeric      | 6      | Trailing spaces                                                                                                                                                                   |
| Filler               | Alphanumeric | 30     | Spaces                                                                                                                                                                            |

### PVV/PIN Offset File trailer record

| Field Name               | Attribute    | Length | Comments/Values     |
|--------------------------|--------------|--------|---------------------|
| Record type ID           | Alphanumeric | 3      | TRL: trailer record |
| Number of detail records | Numeric      | 11     | Detail record count |
| Filler                   | Alphanumeric | 50     | Spaces              |

## In-flight Commerce Blocked Gaming File

The In-flight Commerce (IFC) Blocked Gaming File has these specifications.

### Report overview

|             |                                                                  |
|-------------|------------------------------------------------------------------|
| Frequency:  | Generated twice per month                                        |
| Media:      | Bulk File (bulk type T104) or Mastercard File Express (ID AM005) |
| LRECL:      | 100                                                              |
| Format:     | Fixed block                                                      |
| Block Size: | 1,000                                                            |

Refer to the following file layouts for both bulk file and Mastercard File Express.

### IFC Blocked Gaming File header record

| Field Name      | Position | Length   | Comments/Valid Values  |
|-----------------|----------|----------|------------------------|
| Record Type     | 1-3      | 3        | Constant RHD           |
| Processing Date | 4-11     | 8        | Date of file creation. |
| Format:         | =        | YYYYMMDD | Must be numeric        |
| YYYY            | =        | year     |                        |
| MM              | =        | month    |                        |
| DD              | =        | day      |                        |
| Filler          | 12-100   | 89       | Valid values: spaces   |

### IFC Blocked Gaming File Financial detail record

| Field Name  | Position | Length | Comments/Valid Values |
|-------------|----------|--------|-----------------------|

| Field Name     | Position | Length | Comments/Valid Values                                                                                            |
|----------------|----------|--------|------------------------------------------------------------------------------------------------------------------|
| From BIN       | 4-22     | 19     | First account number in the BIN range to be blocked.<br><br>Format: numeric, left-justified with trailing zeros. |
| To BIN         | 23-41    | 19     | Last account number in the BIN range to be blocked.<br><br>Format: numeric, left-justified with trailing nines.  |
| ICA            | 42-46    | 6      | ICA number associated with the blocked BIN.<br><br>Format: numeric, left-justified with trailing zeros.          |
| Effective Date | 47-54    | 8      | Date the BIN should begin being blocked.                                                                         |
| YYYY           | =        | year   | Must be numeric                                                                                                  |
| MM             | =        | month  |                                                                                                                  |
| DD             | =        | day    |                                                                                                                  |
| Filler         | 55-100   | 46     | Valid values: spaces                                                                                             |

#### IFC Blocked Gaming File trailer record

| Field Name   | Position | Length | Comments/Valid Values |
|--------------|----------|--------|-----------------------|
| Record Type  | 1-3      | 3      | Constant TRL          |
| Record Count | 4-12     | 9      | Numeric               |
| Filler       | 13-100   | 88     | Valid values: spaces  |

## Detail Account Report: Mastercard Digital Enablement Service Device Tokens (AM730010-BB)

The Detail Account Report: Mastercard Digital Enablement Service Device Tokens (AM730010-BB) contains all tokenized device account listings for a customer. This report shows device tokens currently on file with the digitization service and their associated status (active, suspended, or deactivated).

The Detail Account Report: Mastercard Digital Enablement Service Device Tokens (AM730010-BB) separates all tokenized device account listings from the Detail Account Report (AM730010-AA). This allows customers to view device tokens alone in one report every month, if they opt to receive it. This report eliminates the need to scan through the list of all types of accounts (including non-tokens) to check a specific device token.

The Detail Account Report: Mastercard Digital Enablement Service Device Tokens (AM730010-BB) uses the same structure as the Detail Account Report (AM730010-AA).

**NOTE: Tokenized account listings are no longer located on the Detail Account Report (AM730010-AA).**

The Detail Account Report: Mastercard Digital Enablement Service Device Tokens (AM730010-BB) contains the following sections:

- Secure Element Tokens
- Mastercard Cloud-Based Payments Tokens

These two sections identify the type of device token provisioned via the MDES.

The Secure Element Tokens section is present when Mastercard has one or more secure element tokens on file for the issuer in the Account Management System.

The Mastercard Cloud-Based Payments Tokens section is present when Mastercard has one or more Mastercard Cloud-Based Payments tokens on file for the issuer in the Account Management System.

The Detail Account Report: Mastercard Digital Enablement Service Device Tokens (AM730010-BB) is provided monthly via the T318 bulk file or eService OnLine Reports.

For a sample of the Detail Account Report: Mastercard Digital Enablement Service Device Tokens (AM730010-BB), refer to the [Account Management System User Manual](#).

# Appendix A Message data elements

*These tables list all data elements (DEs) implemented within the ISO 8583:1987 message standard, both used and not used by the Dual Message Authorization System, in numeric order.*

---

|                                                                            |      |

Some of the products in this chapter are optional. Mastercard does not require acquirers or issuers to enroll in these optional products and services unless Participation Requirements state otherwise. Acquirers and issuers must code their systems to support these fields to leverage such product and services in a timely manner in the event of a security issue.

## Account Level Management

Mastercard Account Level Management is a platform that enables specialized processing so that Mastercard can manage capabilities at the individual card account level.

Mastercard Account Level Management provides issuers the flexibility of qualifying cardholder accounts for competitive interchange as well as upgrading cardholder accounts to different products.

The following are the key capabilities of Account Level Management functionality:

- Enhanced Value
- Product Graduation Plus
- Product Graduation Select
- High Value
- Spend Shortfall (World Mastercard and World Elite Mastercard)
- Small Business Spend Processing

For more information, refer to the [Account Level Management Manual](#).

## Alternate Processing

Both Stand-In Authorization and X-Code verify that DE 38, position 6 in the Authorization Request Response/0110 message contains the value provided by the Dual Message Authorization System in DE 48, subelement 38 of the Authorization Request/0100 message.

### Stand-In Authorization for Product Graduation

Stand-In Authorization supports Product Graduation. For product graduated accounts, Stand-In Authorization uses the product code in DE 63, subfield 1 instead of the product code associated with the authorization account range when applying Stand-In Authorization limits at the product code level.

### Graduated Product Code Limits

Mastercard offers issuers graduated product code limits as an option for defining Stand-In Authorization parameters for graduated accounts. Issuers can establish limits at the authorization account range level for each product code supported for Product Graduation. These limits will apply specifically to accounts within that account range that are graduated to that product and can be different from the limits that the issuer establishes for an account range that is associated to the same product code. If the issuer takes no action to establish limits for product codes supported for Product Graduation, the Mastercard default limits for the graduated product will apply. Mastercard provides the *Stand-In Processing Transaction Category*

Code *Global Parameters* (Form 041g) available on Mastercard Connect™ for issuer defined limits.

### X-Code Processing

If the product code in DE 63, subfield 1 is different than the product code assigned to the authorization account range, X-Code applies product code limits using the product code in DE 63, subfield 1.

## Account Management System

Account Management System (AMS) services include account-level services that issuers use to designate special handling during authorization. Issuers can list cardholder accounts as exception accounts or accounts with a preferred status.

For more information, refer to the [Account Management System User Manual](#).

## Cross-Border Fee Manager Service

The Cross-Border Fee Manager service is an optional service that gives issuers the flexibility to set markup rates for both currency-conversion and cross-border transactions, taking into account a variety of parameters.

Through this service, Mastercard offers two different methods, Currency Conversion Method and Cross Border Flex Method. Issuers may use these methods to add a markup.

Participating issuers may implement any combination of the following methods and add the associated fees to the total cardholder billing amount.

- Currency Conversion Method: Allows issuers to charge cardholders a percentage rate, fixed amount, or both by applying a markup to currency-converted transactions that may be further filtered by setup parameters.
- Cross-Border Flex Method: Allows issuers to charge cardholders an additional percentage rate, fixed amount, or both by applying a markup to cross-border transactions that may be further filtered by setup parameters.

**NOTE: Issuers may only participate in the Currency Conversion Method and the Cross-Border Flex Method where permitted by local regulations.**

For more information, refer to the [Cross-Border Fee Manager Service Program Guide](#).

## Debit Online Low Risk Merchant (DOLM) program

The DOLM Program is a program for Belgium that is available to e-commerce merchants that have their transactions processed by acquirers located in the European Economic Area (EEA) countries, United Kingdom, and Gibraltar and to issuers of Maestro cards supporting e-

commerce in Belgium. Eligible acquirers must have a licensed area of use in the EEA countries, United Kingdom, and Gibraltar.

**NOTE: Applies only to cards issued in Belgium.**

The request to participate in the program must be submitted by the merchant and its acquirer.

For participating merchants, the program facilitates acceptance of Maestro cards issued in Belgium.

### **DOLM eligibility requirements**

For each merchant, the acquirer must contact its local Mastercard representative to obtain the DOLM participation request form and submit the completed form to its Mastercard representative. Mastercard staff will review the participation request form and notify the acquirer if the merchant has been enrolled in the program. The DOLM Program does not apply to Mastercard branded cards issued in Belgium.

Merchant participation in the program is subject to an eligibility check process to verify that the e-commerce merchant fulfills the following program requirements:

- Maintains fraud rates of less than or equal to 10 basis points for the two consecutive quarters preceding the application for Mastercard and Maestro transactions
- Supports 3D-Secure (3DS) to enable Strong Customer Authentication (SCA) performed by the issuer
- Uses 3DS per the DOLM Operations Requirements section of this bulletin announcement
- Maintains an acquired combined Mastercard and Maestro volume exceeding EUR 100,000 per month for the last 12 months
- For new merchants, completes a Franchise Management Program (FMP) questionnaire to describe its internal risk management processes and tools

### **DOLM operational requirements**

Approved merchants must obtain SCA from the issuer through 3DS at the time of registration of the card payment data on the merchant account. Issuers of Maestro cards in Belgium will require SCA on every recurring payment and Merchant-Initiated Transaction (MIT) coming from every merchant that is not registered into DOLM.

On subsequent transactions, approved merchants must populate the following:

- Data element (DE) 48 (Additional Data: Private Use), subelement 32 (MasterCard Assigned ID) in the Authorization Request/0100 message with a Mastercard-assigned ID
- DE 48, subelement 43 (Universal Cardholder Authentication Field [UCAF]) in the Authorization Request/0100 message with the Mastercard-assigned static AAV of 5MUPPPROGRAM9999999999999999
- DE 48, subelement 42 (Electronic Commerce Indicators), subfield 1 (Electronic Commerce Security Level Indicator and UCAF Collection Indicator) in the Authorization Request/0100 message with the value 213

- Private data subelement (PDS) 0052 (Electronic Commerce Security Level Indicator), subfield 3 (UCAF Collection Indicator) in the clearing record with a value of 3.
- PDS 0176 (Mastercard Assigned ID) in the clearing record submitted to GCMS for processing with a Mastercard-assigned ID

In addition, approved merchants must populate the following requirements to comply with PSD2 to process MITs or recurring payments in a controlled way:

- MIT or recurring payment exemption flag in DE 48, subelement 22 (Multi-Purpose Merchant Indicator), subfield 01 (Low-Risk Merchant Indicator)
- Trace ID in DE 48, subelement 63 (Trace ID), including either the:
  - Trace ID of the initial authorization
  - Value of MCC9999991231\_\_ if the initial authorization was sent before PSD2 became effective (known as grandfathering under PSD2)

### DOLM reviews by Fraud Management Program (FMP)

Merchant fraud levels are measured by acquirer ICA number on a six-month basis. Should the merchant's fraud threshold of 10 basis points be exceeded on Mastercard and Maestro transactions together, the acquirer and the merchant will receive an advisory letter from Mastercard and must undertake a FMP review.

The Mastercard FMP is dedicated to supporting healthy acquirer and merchant growth. The program works with customers to help ensure that they understand and operate within Mastercard Standards to minimize operational, financial, reputational, and compliance risk.

Mastercard is committed to working closely with its customers to fully understand their business dynamics and rationale, while helping to ensure that customers conduct their business in a risk-averse manner. In addition, the FMP provides industry best practices to support business growth by enhancing the overall operational efficiency and profitability while maintaining losses at an acceptable level.

The FMP review format for under-performing merchants is as follows:

- Mastercard will forward the DOLM FMP notification and questionnaire to the acquirer to complete and return within an agreed time frame.
- Mastercard will validate the fraud basis points provided by the merchant and acquirer to help ensure compliance with the DOLM fraud basis point criteria.
- Mastercard will review the completed questionnaire and provide a report to the merchant identifying potential gaps within the merchant's existing fraud control measures and, where appropriate, provide industry best practice guidelines.
- Mastercard will bill the registering acquirer via the Mastercard Consolidated Billing System (MCBS) upon completion of the review. Refer to the online digital *Pricing Guide*, available in the **Pricing and Billing Resource Center** on Mastercard Connect, for details.
- If a merchant's fraud basis points are found to exceed DOLM criteria, Mastercard will agree to an action plan with the merchant or acquirer to reduce the fraud basis points to a level less than the DOLM criteria within an agreed time frame.

## DOLM transactions and fraud liability

Liability and chargeback rights as defined in the [Chargeback Guide](#) will apply. Refer to the [Chargeback Guide](#) for more information. Generally speaking:

- When an approved merchant does not authenticate the cardholder using 3DS and submits a transaction under the DOLM program with a SLI of 213, the issuer has the right to charge back the transaction for fraud if the cardholder states he or she did not authorize the transaction.
- In the initial recurring payments and MITs set up, SCA is a regulatory requirement. The issuer bears liability in case of fraud, as 3DS was used and the issuer applied SCA. The SLI for this scenario can be either 212 or 217.
- For subsequent recurring payments and MITs, the merchant bears liability in case of fraud if the acquirer applied an exemption or exclusion and no 3DS was used. The SLIs for this scenario can be either 210 or 213 or 214 or 216. In the context of DOLM, the SLI will be 213. The acquirer may be able to defend fraud-related chargebacks by providing compelling evidence documenting authentication of the cardholder using 3DS at the start of a recurring transaction arrangement. However, the issuer then still may consider addressing the dispute using a non-fraud chargeback reason code if the issuer can fulfill the conditions (for example, the cardholder notified the merchant to cancel the recurring transaction and the merchant continued to bill the cardholder, or the cardholder was not aware that the cardholder was agreeing to a recurring transaction).

Pre-arbitration case filing is not available when the acquirer provided compelling evidence documenting authentication of the cardholder using Mastercard® SecureCode™ at the start of a recurring transaction arrangement.

## Digital Secure Remote Payment

A Digital Secure Remote Payment (DSRP) transaction is an electronic commerce transaction that contains cryptographic information, in the form of either full EMV chip data passed in DE 55 or a cryptographic value derived from an M/Chip cryptogram passed in the Universal Cardholder Authentication Field (UCAF) or in the Digital Payment Data field.

After the initial DSRP transaction, a related transaction for a partial shipment may occur, in which case, cryptographic information is not passed. When a DSRP transaction contains tokenized account information, Mastercard Digital Enablement Service (MDES) performs token mapping and cryptographic validation services.

DSRP transactions have the capability to include dynamic data to provide evidence that cardholder verification has been performed.

For more information, refer to the [MDES Digital Secure Remote Payment Acquirer Implementation Guide](#) and [MDES Technical Specifications for Dual and Single Message Systems](#).

## Fleet Card transactions

The Mastercard Corporate Fleet Card® is designed to monitor and control fuel and maintenance expenses. A Mastercard Corporate Fleet Card program can be assigned to an individual employee or to a vehicle.

Mastercard Corporate Fleet Card transactions are identified with a specific dedicated Primary Account Number BIN range and a Financial Network Code of MCF (Mastercard Corporate Fleet Card) and MGF (Mastercard Government Commercial Card).

For more information, refer to the [Fleet Implementation Guide Global](#) and [Fleet Implementation Guide For the U.S. Region](#).

### Incentive interchange rates

Acquirers receive incentive interchange rates for transactions that support the data collection requirements of Mastercard Corporate Fleet Card® transactions.

To receive the incentive interchange rates for Fleet Card transactions, acquirers must capture specific data to support submission requirements for clearing records.

For clearing record requirements, refer to the appropriate regional interchange manual.

### Transmitting Fleet Card data in Authorization Request/0100 and Authorization Advice/0120 messages

To support Fleet Card transactions and qualify for specific incentive interchange programs, acquirers must include specific data in Authorization Request/0100 and Authorization Advice/0120 - Acquirer-generated messages.

The Product Type Code determines which data is required from merchant terminals that recognize the Product Type Code on the magnetic stripe or magnetic stripe equivalent data on the EMV chip.

The Product Type Code determines the:

- Terminal prompt at the POI location
- Data that the acquirer must include in the DE 48 (Additional Data: Private Use) field of the Authorization Request/0100 message and Authorization Advice/0120 - Acquirer-generated message

### Terminal prompt at the POI location

When the merchant terminal reads the Product Type Code, the terminal responds by prompting for certain information.

## Product type code values

| Product type code value | Terminal prompt: acquirer may receive from merchant |
|-------------------------|-----------------------------------------------------|
| 1                       | ID Number and Odometer                              |
| 2                       | Vehicle Number and Odometer                         |
| 3                       | Driver Number and Odometer                          |
| 4                       | Odometer Only                                       |
| 5                       | No Prompt                                           |

### Data in the Authorization Request/0100 and Authorization Advice/0120 messages

When the acquirer receives the Fleet Card data from the merchant, the acquirer must include some of the data in the DE 48 (Additional Data: Private Use) field of the Authorization Request/0100 message and Authorization Advice/0120: acquirer-generated message.

### Product type code value details

| Product type code value | Acquirer must include in the 0100 message and 0120 message | Position in the Authorization Request/0100 and Authorization Advice/0120 messages |
|-------------------------|------------------------------------------------------------|-----------------------------------------------------------------------------------|
| 1                       | ID Number                                                  | DE 48, subelement 98                                                              |
| 2                       | Vehicle Number                                             | DE 48, subelement 99                                                              |
| 3                       | Driver Number                                              | DE 48, subelement 98                                                              |
| 4                       | None                                                       | None                                                                              |
| 5                       | None                                                       | None                                                                              |

### Fleet Card Authorization Response

Acquirers that support the Fleet Card program must also be able to interpret the additional data provided by the issuer in DE 44 (Additional Response Data) of the Authorization Request Response/0110 message.

If the issuer declines a transaction because of an invalid driver, ID, or vehicle number, the issuer returns an Authorization Request Response/0110 message with value 12 in DE 39 (Response Code). The issuer returns additional data in DE 44 that explains the reason for the decline. The terminal at the point-of-interaction must display this additional data.

**Transmitting Fleet Card data in Authorization Request/0100 and Authorization Advice/0120 messages for transactions supporting Connexus/IFSF Standards**

The Fleet Prompted Data determines which data is required from merchant terminals that recognize the Fleet Prompted Data information on Connexus/International Forecourt Standards Forum (IFSF) industry standard EMV chip fleet cards.

The Fleet Prompted Data determines the:

- Terminal prompt at the POI location
- Data that the acquirer must include in DE 106 (Fleet Service Data), subelement 1 (Fleet Prompted Data) field of the Authorization Request/0100 message and Authorization Advice/0120: acquirer-generated message

**Terminal prompt at the POI location**

When the merchant terminal reads the Fleet Prompted Data, the terminal responds prompting the cardholder to input specific information at the point of interaction. For a complete list of current prompt codes, refer to DE 106 (Fleet Service Data), subelement 1 (Fleet Prompted Data).

**Data in the Authorization Request/0100 and Authorization Advice/0120 messages**

When the acquirer receives the Fleet Card prompted data from the merchant, the acquirer must include the data in the DE 106 (Fleet Service Data) field of the Authorization Request/0100 message and Authorization Advice/0120: acquirer-generated message.

**Fleet prompt number details**

| <b>Fleet Prompt Number</b> | <b>Acquirer must include in the Authorization Request/0100 message and optionally in the Authorization Advice/0120 message</b> | <b>Position in the Authorization Request/0100 or Authorization Advice/0120 message</b> |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------|
| Fleet Prompt 1             | Prompt Code 1                                                                                                                  | DE 106, subelement 1, subfield 1, position 1-3                                         |
| Fleet Prompt 1             | Driver-Related Data 1                                                                                                          | DE 106, subelement 1, subfield 1, position 4-38                                        |

When the acquirer receives the details of fuel items purchased with a Fleet Card, they should provide that information in DE 106 (Fleet Service Data), subelement 4 (Fleet Fuel Information).

When the acquirer receives the details of non-fuel items purchased with a Fleet Card, they should provide that information in DE 106 (Fleet Service Data), subelement 5 (Fleet Non-Fuel Information).

### Initiating Fleet Card Support

To learn more about supporting the Fleet Card program, contact Global Customer Service.

## Issuer Currency Conversion Rate (ICCR) service

The ICCR is a parameter-based service that charges cardholders for currency conversion by applying a mark-up in clearing.

This supplemental fee is added to the transaction amount when the transaction currency is different from the cardholder billing currency. This fee is included in DE 6 (Amount, Cardholder Billing).

Issuers set the additional fee for the ICCR by account range, which applies to First Presentment messages.

Issuers can receive daily audit report files of the clearing transactions where the ICCR was applied. Bulk File TN70 (On Request Report Data File Transfer Raw Format) supports the daily audit report files.

ICCR applies to POS and ATM transactions acquired worldwide.

In the Dual Message Authorization System, all payment transactions (processing code = 28) will be bypassed for ICCR.

## Issuer Security Solutions

Mastercard offers best-in-class fraud management solutions to help issuers tackle fraud from every angle.

These solutions were developed to control the cost of fraud, protect cardholders, and minimize potential reputational damage to issuers. Mastercard addresses multi-channel fraud by layering security strategies, policies, and technologies at each stage of the payment life cycle.

For more information, refer to the [Mastercard Security Solutions Guide for Issuer Services](#).

## Decision Intelligence

Decision Intelligence is a real-time authorization decisioning solution that applies thousands of data points and sophisticated modeling techniques to each transaction, simplifying these insights into a single transaction decision score. This score helps issuers fine-tune their authorization decisions with the goal of approving genuine transactions and declining fraudulent ones.

Decision Intelligence enables smarter decisioning, giving issuers a multi-dimensional authorization tool to assess both the risks and rewards of every transaction, so they can enhance the consumer experience by approving more genuine transactions without increasing risk. Decision Intelligence evaluates information about consumers, merchants, and issuers during the shopping experience to help issuers decide whether a transaction makes sense and if it should be approved or declined.

## Decision Intelligence: Authorization IQ feature

In an overall effort to reduce and prevent fraud, Mastercard provides Authorization IQ, an actively managed segmentation feature of the Decision Intelligence service that can help issuers increase approvals and ensure a more satisfying consumer experience without incurring greater risk.

Authorization IQ gives issuers targeted, real-time segmentation insights to help them identify best-spending or most frequent-spending cardholders who show the greatest revenue opportunity at the time of card usage. The service adds a critical dimension to decision management strategies, supplementing and expanding fraud detection, by providing tangible data points to enable data-driven authorization strategies.

## Digital Transaction Insights

Through the Decision Intelligence service, Mastercard provides Digital Transaction Insights, an information exchange framework that enables merchants to share electronic commerce (ecommerce) data with issuers in card-not-present (CNP) environments.

Digital Transaction Insights (DTI) helps improve authorization risk decisioning for card not present (CNP) transactions by connecting billions of data points from the Mastercard payment network and Identity Network merchant risk assessments, and our proprietary models trained on global and region-specific data.

DTI is shared in the authorization message when a merchant submits a transaction through the Mastercard Identity Check network, either as a payment authentication or an Identity Check Insights request. Issuers can work with their authorization processor to integrate DTI into approval or decline decisioning.

## Mastercard ATM Cash Pick-Up service

The Mastercard ATM Cash Pick-Up service allows money to be sent to individual recipients who obtain their funds from an ATM which has been upgraded with the ATM Cash Pick-Up software.

The service recipients receive a code (via, for example, a Short Message Service [SMS] text message) that they can enter into the ATM; therefore, they do not need a debit card or relationship with a bank to receive funds.

The Mastercard ATM Cash Pick-Up service provides the following use cases for customers engaging in the service:

- Relief Fund Disbursement
- Emergency Cash Assistance
- Cash Rewards
- Person to Person Payments
- Small Insurance Claims
- Government Aid Payments/Social Benefits
- Compensation

For more information, refer to the [Mastercard Cash Pick-up Program Guide](#).

## Mastercard Commercial Payments Account

This section describes Dual Message Authorization System edits supporting the introduction of the MAP (Mastercard Commercial Payments Account) product code in Brazil and the Mastercard European Economic Area subregion.

### Dual Message Authorization System Edit to Support MAP in Brazil

Mastercard offers a domestic card-not-present (CNP) commercial payment solution in Brazil using the product code MAP.

The Dual Message Authorization System performs the following system edit to ensure product code MAP is used only in CNP transactions in Brazil.

Mastercard Contactless Mapping service

Mastercard® Contactless Mapping service uses proximity chip payment technology so consumers can pay for their purchases at the point of sale by simply tapping their contactless card or device on a contactless terminal.

The contactless card or device transmits the card information to the terminal. The contactless terminal interacts with existing authorization mechanisms to initiate and complete the authorization. The increased speed and convenience make contactless an attractive way to pay,

especially in high- traffic environments such as mass transit stations, movie theaters, and fast food restaurants.

The Contactless Mapping Service is not available to issuers that support the use of online PIN with a card or device product. If PAN mapping is performed in a transaction using online PIN, the PIN validation will fail.

For more information, refer to the [Contactless On-behalf Services Guide](#).

## Contactless Mapping Service description

Mastercard recommends that a unique account number be used for contactless transactions. This added layer of security protects issuers and cardholders against the risk of fraudulent acquisitions and use of a contactless account number.

One cardholder account is assigned two numbers:

- A primary account number (PAN), which is encoded on the magnetic stripe and printed on the card.
- A different contactless account number, which is personalized on the contactless chip of the same card or on a companion contactless device.

Implementation of a separate contactless account number requires the issuer to:

- Allocate a contactless account number and provide Contactless Mapping functionality to the existing PAN.
- Establish and maintain a cross-reference or mapping database between the PAN and the contactless account number.
- Upgrade the issuer host system to recognize that both account numbers must debit the same cardholder account and that:
  - The contactless account number must be accepted only when the transaction is originated at a contactless terminal.
  - The PAN must be accepted only when the card is swiped or when the PAN is provided by manual entry on a POS, on the Internet, or over the phone.

A contactless account number is a unique number encoded on the proximity chip of a contactless card or device that the Contactless Mapping Service associates to a PAN. A primary account number (PAN) is the number that is printed, encoded, or both, on a Mastercard card that identifies the issuer and the particular cardholder account.

Mastercard recognizes that the use of a separate contactless account number for some issuers may not be viable. For this reason, Mastercard offers the Contactless Mapping Service, which is an optional service that helps issuers process contactless transactions by translating contactless account numbers into primary account numbers that issuers can process with minimal impact.

Mastercard offers two options for participating in for the Contactless Mapping Service:

- Processing-only: At setup, the participating issuer provides Mastercard with a mapping file of PANs and contactless account numbers created and personalized on contactless cards or devices.
- Processing and Contactless Mobile Over-the-Air Provisioning: Mastercard offers secure web services that allow issuers to request both the contactless personalization of a near-field communication (NFC) mobile phone and its activation. Through the activation process, the registered PAN and contactless account number are mapped together. This option is available depending on the issuer market.

Processing that is common to both participation options consists of the Dual Message Authorization System translating contactless authorization requests into messages that the issuers' non-contactless-enabled authorization systems can understand and process.

## Contactless Mapping Service components

The Contactless Mapping Service consists of certain Dual Message Authorization System components.

- PAN Mapping File (MCC106)
- Processing of contactless account number
- Transaction history

**NOTE: Dynamic CVC 3 pre-validation is used when the Contactless Mapping Service is performed on contactless magnetic stripe transactions.**

## Contactless account number

After performing edits, the Dual Message Authorization System maps the contactless account number to the cardholder's PAN if indicated for the service-eligible contactless account range.

The following information provides the Dual Message Authorization System processing details when the contactless account number is in a Contactless Mapping Service-eligible account range and listed or not listed in the PAN Mapping File (MCC106).

### When the PAN Mapping File (MCC106) contains a contactless account number

If the contactless account number is in the PAN Mapping File (MCC106), the Dual Message Authorization System performs the following actions on Authorization Request/0100, Authorization Advice/0120, Reversal Request/0400, and Reversal Advice/0420 messages forwarded to the issuer, Stand-In Authorization, or X-Code.

- Inserts the cardholder's PAN in DE 2 (Primary Account Number [PAN])
- Inserts the PAN card expiration date in DE 14 (Date, Expiration) if available; otherwise, DE 14 is not present
- Performs dynamic CVC 3 pre-validation using CVC 3 validation key and algorithm only on the Authorization Request/0100 message where DE 22 (Point-of-Service [POS] Entry Mode), subfield 1 (POS Terminal PAN Entry Mode) contains value 91 (PAN auto-entry through contactless magnetic stripe)

- Performs Chip Cryptogram pre-validation (if the issuer is enrolled) on the Authorization Request/0100 message where DE 22 (Point-of-Service [POS] Entry Mode), subfield 1 (POS Terminal PAN Entry Mode) contains value 07 (PAN auto-entry through contactless M/Chip)
- Inserts the results of the CVC 3 validation in DE 48 (Additional Data: Private Use), subelement 71 (On-behalf Services) if DE 22, subfield 1 contains value 91 or, if applicable, the result of the Chip Cryptogram if DE 22, subfield 1 contains value 07
- If DE 22, subfield 1 contains value 91, inserts DE 48, subelement 34 (Dynamic CVC 3 ATC Information) when the CVC 3 validation result was value V (Valid), A (ATC outside allowed range), or E (CVC 3 ATC Replay)
- Changes DE 22, subfield 1, value 91 (PAN auto-entry through contactless magnetic stripe) to value 92 (Contactless input, Contactless Mapping Service applied when acquirer DE 22, subfield 1 = 91); or value 07 (PAN auto-entry through contactless M/Chip) to value 08 (PAN auto-entry through contactless M/Chip Contactless Mapping Service applied)
- Removes DE 35 (Track 2 Data) or DE 45 (Track 1 Data) or both
- Inserts DE 48, subelement 71 (On-behalf Services) results for Contactless Mapping Service

**NOTE: In the contactless magnetic stripe Authorization Request/0100 message to the issuer, DE 48, subelement 71 contains two service results: one for the Dynamic CVC 3 Pre-validation service and one for the Contactless Mapping Service.**

For Authorization Request Response/0110, Authorization Advice Response/0130, or Reversal Request Response/0410 messages forwarded to acquirers, the Dual Message Authorization System:

- Inserts DE 48, subelement 33 (PAN Mapping File Information)
- Inserts DE 48, subelement 87 (Card Validation Code Result) only in the contactless magnetic stripe Authorization Request Response/0110 response if there were issues with the validation of the CVC 3

Acquirer response messages contain the same DE 2 value that was submitted by the acquirer.

### **When the PAN Mapping File (MCC106) does not contain a contactless account number**

If the contactless account number is not in the PAN Mapping File (MCC106), the Dual Message Authorization System:

- Rejects the Authorization Request/0100, Authorization Advice/0120, or Reversal Request/0400 message and sends the acquirer the corresponding Authorization Request Response/0110, Authorization Advice Response/0130, or Reversal Request Response/0410 message with DE 39 (Response Code), value 14 (Invalid card number)
- Creates and sends an Authorization Advice/0120 message with DE 60 (Advice Reason Code), value 140 (Unable to Convert Contactless Account Number) to the issuer

## Alternate processing

When applied to contactless magnetic stripe or contactless M/Chip transactions, the Contactless Mapping Service is performed before any alternate routing to Stand-In Authorization or X-Code.

Mastercard supports issuers that are not available to respond to the Authorization Request/0100 message by considering the results of the CVC 3 or Chip Cryptogram validation in DE 48, subelement 71 when Stand-In Authorization responds to the Authorization Request/0100 message. The options available for Stand-In Authorization processing of CVC 3 results are detailed in [On-behalf Key Management Procedures](#) and [On-behalf Key Management Interface Specifications](#).

If Stand-In Authorization rejects a contactless magnetic stripe Authorization Request/0100 message because of issuer instructions based on CVC 3 validation results, Stand-In Authorization includes in the contactless magnetic stripe Authorization Advice/0120 message sent to the issuer the following values in DE 60, subfield 2:

- 0042 (CVC 3 Unable to Process)
- 0043 (CVC 3 ATC outside allowed range)
- 0044 (CVC 3 Invalid)
- 0045 (CVC 3 Unpredictable number mismatch)
- 0046 (CVC 3 ATC Replay)

In addition, the contactless magnetic stripe Authorization Advice/0120 message includes:

- DE 48, subelement 71
- DE 48, subelement 34, if DE 48, subelement 71, value V, A, or E
- DE 48, subelement 33
- DE 48, subelement 87, if there was a problem with the CVC validation

For more information about additional values sent if Stand-In Authorization rejects a contactless M/Chip Authorization Request/0100 message because of issuer instructions based on the Chip Cryptogram validation results, refer to the [M/Chip Processing Services Service Description Guide](#).

Mastercard does not consider the CVC 3 or Chip Cryptogram validation results in X-Code Processing and may approve an authorization request with an invalid CVC 3 or Chip Cryptogram.

## Authorization reports

The Authorization Parameter Summary Report (SI737010-AA) and Daily Account File Activity Report (AM700010-DD) reports provide information that supports the Contactless Mapping Service.

- The Authorization Parameter Summary Report (SI737010-AA) provides an indicator in the Global Parameters section to identify the account ranges that are participating in the Contactless Mapping Service. Additionally, the On-behalf Services section lists the Dynamic

CVC 3 Pre-validation Service for the participating Contactless Mapping Service account ranges and one of the Chip Cryptogram Validation Services if the issuer is enrolled in these services.

- The Daily Account File Activity Report (AM700010-DD) contains the PAN Mapping File activity.

For a sample of the Authorization Parameter Summary Report (SI737010-AA), refer to [Reports and files](#). For a sample of the Daily Account File Activity Report (AM700010-DD), refer to the [Account Management System User Manual](#).

## Mastercard Digital Enablement Service

The Mastercard Digital Enablement Service (MDES) is a secure, globally-scalable digitization platform for the management, generation, and provisioning of digital payment credentials onto mobile devices, PCs, servers, and other form factors. This provides simpler, more secure digital payment experiences.

MDES was developed to facilitate the financial industry transition from consumer account credentials stored on payment cards to digital credentials provisioned into mobile devices. These digitized credentials enable consumers to perform:

- Payments via existing contactless POS, other POS systems, and newer remote payment methods, such as in-app payments.
- Cash withdrawals or other financial transactions occurring at contactless ATMs with the use of Near Field Communications (NFC)-enabled devices and wallets.

MDES technology has been enhanced to allow the digitization of cardholder credentials stored on servers, facilitating more secure browser-based electronic commerce (e-commerce) and in-app transactions.

For more information about issuer participation in MDES, refer to the [MDES Issuer Implementation Guide](#).

## MDES authorization reports

The Authorization Parameter Summary Report, Daily Account File Activity Report, and Detail Account Report contain information about MDES.

- The Authorization Parameter Summary Report (SI737010-AA) includes a MDES participant parameter in the Global Parameters section.
- The Daily Account File Activity Report (AM700010-AA) includes activity for MDES within AM700010-CC.
- The Detail Account Report (AM730010-AA) includes a section for MDES accounts.

**NOTE: Tokenized device account listings are now listed on the Detail Account Report: Mastercard Digital Enablement Service Device Tokens (AM730010-BB). Refer to the [MDES Register for Issuer Pre-digitization Network Message Values](#) section.**

For a sample of the Authorization Parameter Summary Report (SI737010-AA), refer to [Reports and files](#). For samples of the Daily Account File Activity Report (AM700010-CC) and Detail Account Report (AM730010-AA), refer to the [Account Management System User Manual](#).

## MDES Register for Issuer Pre-digitization Network Message Values

The following Dual Message Authorization System message layouts support real-time messages for tokenization.

MDES Pre-Digitization API documentation that describes the API messages and parameters is available on the Mastercard Developers site.

### Tokenization Eligibility Request (TER)

Following is a list of the data elements, values, and subfields applicable for Tokenization Eligibility Request (TER).

- [Authorization Request/0100 for TER](#)
- [DE 124 Subfields in Authorization Request/0100 for TER](#)
- [Authorization Request Response/0110 for TER](#)
- [DE 124 Subfields for Authorization Request Response/0110 for TER](#)

### Authorization Request/0100 for TER

All mandatory Authorization Request/0100 data elements apply.

#### Authorization Request/0100 for TER

## DE 124 Subfields in Authorization Request/0100 for TER

Absolute positioning of data in DE 124 subfields is required. Subfields not containing values will be populated with spaces when they are followed by subfields that contain values. If one or more subfields at the end of the data element do not contain a value, the subfield(s) will not be present and the total length of DE 124 will be reduced by the subfield length(s).

### DE 124 Subfields in Authorization Request/0100 for TER

| Subfield Name  | Attributes | Values/Comments                                                                                    |
|----------------|------------|----------------------------------------------------------------------------------------------------|
| Message Type   | ans-2      | TE = Tokenization Eligibility Request (TER)                                                        |
| Correlation ID | an-14      | Identifier assigned by Mastercard to associate related tokenization request/notification messages. |

| Subfield Name                                          | Attributes                                 | Values/Comments                                                                                                                                                                                                                                                                                                      |
|--------------------------------------------------------|--------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| Payment Application Instance ID                        | ans-48, left-justified, padded with spaces | Identifier associated with the payment application instance installed onto a device.                                                                                                                                                                                                                                 |
| Number of Active Tokens for the Primary Account Number | ans-2, leading zeros                       | Number of active or suspended tokens for the primary account number provisioned to a consumer. Space-filled when requested token digitized to a server.<br><br><b>NOTE: Space-filled means if data is not available then length of that field is filled with space; this is specific to ISO message not for API.</b> |

| Subfield Name                   | Attributes | Values/Comments                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------------------------|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Wallet Provider Account ID Hash | ans-64     | <p>When provided by the Wallet Provider, the issuer may use this hash value to match against known identifiers for the cardholder; for example, their email addresses on file. If the hash values match, this may aid an issuer's digitization decision by providing additional factors to help verify that the Wallet Provider account holder is indeed their cardholder, or to differentiate between primary and secondary cardholders. The Wallet Provider computes the hash over an email address; MDES receives this and includes it in the data sent to the issuer. The issuer computes the hash of the email address on file for the cardholder; if it matches the hash of the one received from the Wallet Provider, the comparison with the hash value received from the Wallet Provider may be used by the issuer to assist determining the digitization decision. Hashing is used to help the issuer verify the cardholder email (or other relevant identifiers that the issuer may have for the cardholder) without the Wallet Provider providing the full email for privacy and security reasons. When the Wallet Provider is Apple Pay, the hash is generated using the PBKDF2 algorithm (PKCS #5). PBKDF2 is performed using 10 iterations, a salt, and the lowercase account ID as the password. The salt is calculated by taking the lower case UTF-8 bytes from the account ID and performing a SHA-256. Hash calculation example:</p> <p>Example: Input (Password): csharp@walletprovider.com</p> <p>Salt:<br/>41404d1bca85ddb59ab21466e277ac1ac5f61470be120c82a21b1e45b5248123</p> <p>Count: 10</p> <p>Output:<br/>7098014b646d44c6f3b454c5d54f7a32b3b46e2b0c8e2367f3e5307e3036dfe6</p> <p>For all other Wallet Providers, the field contains the hash resulting from the following "accountIdHash" algorithm, rightpadded with spaces. "accountId" is the lower case UTF-8 bytes of the account ID:</p> <pre>public String accountIdHash (String accountId) {String random8Bytes = 123CCB2F30BA420B return random8Bytes + lessSignificant24bytes(strongerHash(accountId + random8Bytes))} public String strongerHash(String dataToHash) {String currentHash = dataToHash; for (int i = 0; i &lt; 5000; i++) {currentHash = sha256(currentHash);} return sha256(sha256(dataToHash) + currentHash);}</pre> |

| DE 39 (Response Code)        | M   | .   | .   | <p>One of the following values indicating how the issuer wants Mastercard to proceed with the tokenization process:</p> <ul style="list-style-type: none"> <li>• 00 = Continue</li> <li>• 85 = Continue, but require additional authentication</li> <li>• 05 or any other value = Decline</li> </ul> <p><b>NOTE: Issuers must send the appropriate decline response codes when declining a provisioning attempt. This should comply with <i>Mastercard Rules</i> which state the limited use of the 05-Do Not Honor response code on all Mastercard and Maestro cards not present decline responses.</b></p> |
| DE 124 (Member-defined Data) | C   | .   | .   | <p>See layout for DE 124. If the issuer responds with DE 39 = 00 or 85, the issuer may optionally provide DE 124. If the issuer responds with DE 39 = 05, DE 124 must not be present.</p>                                                                                                                                                                                                                                                                                                                                                                                                                    |

## DE 124 Subfields for Authorization Request Response/0110 for TER

Absolute positioning of data in DE 124 subfields is required. Each value must be padded with spaces if the length does not fit exactly the length of the subfield. Subfields not containing values must be populated with spaces when they are followed by subfields that contain values. If one or more subfields at the end of the data element do not contain a value, the subfield(s) will not be present and the total length of DE 124 will be reduced by the subfield length(s).

## DE 124 Subfields for Authorization Request Response/0110 for TER

| Subfield Name                               | Attributes           | Values/Comments                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |      |            |                 |                        |     |                                                                                                                                                                                                                     |

|               | Activation Method Value | ans...183 Refer to the following examples.                                                                                      |
|               | Delimiter               | ans...2 If multiple activation methods are provided by the issuer, the issuer must separate each method with the " " delimiter. |
|               |                         | Following the last character of the final method in the field, the issuer should include two " " delimiters.                    |
|               |                         | Values:                                                                                                                         |
|               |                         | " " indicates another Activation Method follows.                                                                                |
|               |                         | "  " indicates the last Activation Method.                                                                                      |

## Examples

1(###) ### 4567 |

1 = Masked mobile phone number

The 1 will be followed by the masked mobile phone number, then the delimiter.

2a\*\*\*d@anymail.com |

2 = Masked email address

The 2 will be followed by the consumer's masked email address (the issuer will mask according to their own format), then the delimiter.

3(555) 123 4567 |

3 = Automated call center phone number

The 3 will be followed by the phone number, then the delimiter. This phone number is not masked.

|                                                                                                                                                          |
|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| 4(555) 123 8901                                                                                                                                          |
| 4 = Call center phone number                                                                                                                             |
| The 4 will be followed by the phone number, then the delimiter. This phone number is not masked.                                                         |
| 5http://www.anybank.com                                                                                                                                  |
| 5 = Website                                                                                                                                              |
| The 5 will be followed by the issuer’s website URL, then the delimiter.                                                                                  |
| 6com.anybank.mobileapp                                                                                                                                   |
| 6 = Mobile app                                                                                                                                           |
| The 6 will be followed by the issuer’s mobile app information, the content of which depends upon the mobile device operating system, then the delimiter. |
| 7(###) ### 2345                                                                                                                                          |
| 7 = Masked voice call phone number                                                                                                                       |
| The 7 will be followed by the masked voice call phone number. If this were the last Activation Method provided, the value is followed by two delimiters. |
| 9 = Identity check - EMV 3DS                                                                                                                             |

Tokenization Authorization Request (TAR)

Following is a list of the data elements, values, and subfields applicable for Tokenization Authorization Request (TAR).

- [Authorization Request/0100 for TAR](#)
- [DE 124 Subfields in Authorization Request/0100 for TAR](#)
- [Authorization Request Response/0110 for TAR](#)
- [DE 124 Subfields in Authorization Request Response/0110 for TAR](#)

Authorization Request/0100 for TAR

All mandatory Authorization Request/0100 data elements apply.

Authorization Request/0100 for TAR

## DE 124 Subfields in Authorization Request/0100 for TAR

Absolute positioning of data in DE 124 subfields is required. Subfields not containing values will be populated with spaces when they are followed by subfields that contain values. If one or more subfields at the end of the data element do not contain a value, the subfield(s) will not be present and the total length of DE 124 will be reduced by the subfield length(s).

### DE 124 Subfields in Authorization Request/0100 for TAR

## DE 124 Subfields in Authorization Request Response/0110 for TAR

Absolute positioning of data in DE 124 subfields is required. Subfields not containing values must be populated with spaces when they are followed by subfields that contain values. If one or more subfields at the end of the data element do not contain a value, the subfield(s) will not be present and the total length of DE 124 will be reduced by the subfield length(s).

### DE 124 Subfields in Authorization Request Response/0110 for TAR

| Subfield Name                               | Attributes           | Values/Comments                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------------------------------|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Issuer Product Configuration ID             | ans-10               | <p>The unique product configuration identifier provided by the issuer that identifies a particular set of card art, texts and other product related data, provided during the issuer enablement or maintenance process. This ID is case-sensitive.</p> <p>By specifying the Issuer Product Configuration ID on the Tokenization Authorization Request Response, an issuer may override the usual Product Configuration assigned as the default at Account Range level. This allows greater control over exactly which card art and related card product data gets applied as part of a specific tokenization process. However, this does not provide a mechanism to override the Issuer Terms and Conditions file which always comes from the default Product Configuration(s) assigned at Account Range level.</p> |
| Primary Account Number Card Sequence Number | ans-3, leading zeros | The card sequence number associated with the primary account number.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

|----------------------------------------|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Token Data and Activation Method Value | ans...283  | <p>When the Token Data and Activation Method Type is 1, 2, 3, 4, 5, 6, 7 or 9 the issuer must provide values used to specify an activation method. See Examples 1, 2, 3, and 4 for examples of Token Data and Activation Method(s) containing activation method values.</p> <p>Issuers have the option of providing an alternate account identifier in Tokenization Authorization Response messages (Token Data and Activation Method Type = a).</p> <p>An Alternate Account Identifier is a cardholder-friendly reference to a bank account, for example an IBAN (International Bank Account Number). It is typically useful for a Wallet Provider to display a suffix of this identifier to the cardholder to help them identify their tokenized card when they are not aware of their Account PAN.</p> <p>This will enable wallets to display alternate account identifier suffixes depending on the wallet functionality. Issuers must refer to each wallet's documentation to determine if/how the alternate account identifier suffixes are displayed to cardholders.</p> <p>An alternate account identifier is in the format of a string with minimum 9 and maximum 64 characters, with no spaces allowed. An IBAN is an example of an alternate account identifier, as for example, GB82WEST12345698765432.</p> <p>When the Token Data and Activation Method Type is t, the issuer must provide one or multiple proprietary token personalization data items that MDES will include in the token profile. See Example 8 for an example of Token Data and Activation Method(s) containing multiple token personalization data items.</p> <p>Each token personalization data item can have one to multiple instances of couples Token Personalization Data and Separator.</p> <p>Token Personalization Data: Base64 encoded data. Structure and content of data is defined separately per <i>Mastercard Digital Enablement Service (MDES) Issuer Implementation Guide</i>. See Examples 6 and 7.</p> <p>Separator</p> <p>ans...1</p> <p>Each separate token personalization data (including after the last) will be delimited by a "~" character.</p> |

## Authentication Methods Request (AMR)

Following is a list of the data elements, values, and subfields applicable for Authentication Methods Request (AMR).

- [Authorization Request/0100 for AMR](#)
- [DE 124 Subfields in Authorization Request/0100 for AMR](#)
- [Authorization Request Response/0110 for AMR](#)
- [DE 124 Subfields in Authorization Request Response/0110 for AMR](#)

### Authorization Request/0100 for AMR

All mandatory Authorization Request/0100 data elements apply.

#### Authorization Request/0100 for AMR

| Data Element ID and Name      | Org | Sys | Dst | Values/Comments                              |
|-------------------------------|-----|-----|-----|----------------------------------------------|
| DE 2 (Primary Account Number) | •   | X   | M   | Cardholder's primary account number          |
| DE 3 (Processing Code)        | •   | X   | M   | 00 = Purchase                                |
| DE 4 (Amount, Transaction)    | •   | X   | M   | Will be zero                                 |
| DE 14 (Date, Expiration)      | •   | X   | C   | Cardholder's primary account expiration date |

## DE 124 Subfields in Authorization Request/0100 for AMR

Absolute positioning of data in DE 124 subfields is required. Subfields not containing values will be populated with spaces when they are followed by subfields that contain values. If one or more subfields at the end of the data element do not contain a value, the subfield(s) will not be present and the total length of DE 124 will be reduced by the subfield length(s).

### DE 124 Subfields in Authorization Request/0100 for AMR

| Subfield Name          | Attributes                                 | Values/Comments                                                                                                                                        |

## DE 124 Subfields in Authorization Request Response/0110 for AMR

Absolute positioning of data in DE 124 subfields is required. Subfields not containing values must be populated with spaces when they are followed by subfields that contain values. If one or more subfields at the end of the data element do not contain a value, the subfield(s) will not be present and the total length of DE 124 will be reduced by the subfield length(s).

### DE 124 Subfields in Authorization Request Response/0110 for AMR

| Subfield Name                           | Attributes | Values/Comments                                                                                                                                                 |
|-----------------------------------------|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Token Data and Authentication Method(s) | ans...199  | The subfield can have zero to multiple groupings of three Token Data and Authentication Method Type, Token Data and Authentication Method Value, and Delimiter. |

| Subfield Name                              | Attributes | Values/Comments                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## DE 124 Subfields in Authorization Request/0100 for ACN

Absolute positioning of data in DE 124 subfields is required. Subfields not containing values will be populated with spaces when they are followed by subfields that contain values. If one or more subfields at the end of the data element do not contain a value, the subfields will not be present and the total length of DE 124 will be reduced by the subfield lengths.

### DE 124 Subfields in Authorization Request/0100 for ACN

| Subfield Name  | Attributes | Values/Comments                                                                                        |
|----------------|------------|--------------------------------------------------------------------------------------------------------|
| Message Type   | an-2       | AC = Activation Code Notification (ACN)                                                                |
| Correlation ID | an-14      | The Identifier assigned by Mastercard to associate related tokenization request/notification messages. |

## Examples

1(###) ### 4567

1 = Masked mobile phone number

The 1 will be followed by the masked mobile phone number.

2a\*\*\*d@anymail.com

2 = Masked email address

The 2 will be followed by the consumer's masked email address (the issuer will mask according to their own format).

3(555) 123 4567

3 = Automated call center phone number

The 3 will be followed by the phone number. This phone number is not masked.

4(555) 123 8901

4 = Call center phone number

The 4 will be followed by the phone number. This phone number is not masked.

5http://www.anybank.com

5 = Website

The 5 will be followed by the issuer's website URL.

6PUSH\_NOTIFICATION

6 = Mobile app

The 6 will be followed by the PUSH\_NOTIFICATION, that informs issuer that send a push notification to cardholder mobile application instance.

---

7(###) ### 2345

7 = Masked voice call phone number

The 7 will be followed by the masked voice call phone number.

---

8

8 = Push notification

No value is required for 8. Issuer must send a push notification to cardholder mobile banking application with authentication code.

---

## Authorization Request Response/0110 for ACN

All mandatory Authorization Request Response/0110 data elements apply.

### Authorization Request Response/0110 for ACN

## DE 124 Subfields in Authorization Request/0100 for TCN

Absolute positioning of data in DE 124 subfields is required. Subfields not containing values will be populated with spaces when they are followed by subfields that contain values. If one or more subfields at the end of the data element do not contain a value, the subfield(s) will not be present and the total length of DE 124 will be reduced by the subfield length(s).

### DE 124 Subfields in Authorization Request/0100 for TCN

## DE 124 Subfields in Authorization Request/0100 for TVN

Absolute positioning of data in DE 124 subfields is required. Subfields not containing values will be populated with spaces when they are followed by subfields that contain values. If one or more subfields at the end of the data element do not contain a value, the subfield(s) will not be present and the total length of DE 124 will be reduced by the subfield length(s).

### DE 124 Subfields in Authorization Request/0100 for TVN

| Subfield Name  | Attributes | Values/Comments                                                                                    |
|----------------|------------|----------------------------------------------------------------------------------------------------|
| Message Type   | an-2       | TV = Tokenization Event Notification (TVN)                                                         |
| Correlation ID | an-14      | Identifier assigned by Mastercard to associate related tokenization request/notification messages. |

| Subfield Name                  | Attributes | Values/Comments                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| DE 39 (Response Code)            | •   | M   | M   | Indicates disposition of Issuer File Update Request/0302.                                                                |
| DE 44 (Additional Response Data) | •   | C   | C   | May contain additional response information, based on DE 39. Error messages should spell out field in error (ex: 120XXX) |
| DE 91 (Issuer File Update Code)  | •   | ME  | ME  | Must be the same value as in the original Issuer File Update Request/0302.                                               |
| DE 101 (File Name)               | •   | ME  | ME  | Must be the same value as in the original Issuer File Update Request/0302.                                               |
| DE 120 (Record Data)             | •   | ME  | ME  | Must be the same value as in the original Issuer File Update Request/0302.                                               |

## DE 120 Layout for Administrative Advice/0620 Issuer Token Notification Advice

The following tables provides the technical details of DE 120 (Record Data) for Issuer Token Notification Advice for Activation Code Notification, Tokenization Complete Notification and Tokenization Event Notification.

- [Activation Code Notification](#)
- [Tokenization Complete Notification](#)
- [Tokenization Event Notification](#)

### Activation Code Notification

The following table provides the technical details of DE 120 (Record Data) when DE 60 (Advice Reason Code), subfield 1 (Advice Reason Code) contains the value 141 (Mastercard Digital Enablement Service Advice to Issuer) and DE 60, subfield 2 (Advice Detail Code) contains the value 0250 (Activation Code Notification) in the Administrative Advice/0620 message.

Absolute positioning of data in DE 120 subfields is required. Subfields not containing values will be populated with spaces when they are followed by subfields that contain values. If one or more subfields at the end of the data element do not contain a value the subfields will not be present and the total length of DE 120 will be reduced by the subfield lengths.

### Activation Code Notification

| Field ID | Field Name                               | Attributes                                  | Values/Comments                                                                                                                                                                                                                                                                        |

|----------|------------------------|--------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 10       | Reason Code            | ans-6                                      | <p>The reason the account holder is being authenticated. The reason could impact the generation and validation of the code in various ways including but not limited to the time period of validity of the code and the number of attempts allowed to validate the code. New reason codes can be added at any time and should not result in a failure.</p> <p>Bit Position Meaning</p> <p>01 ADD_CARD - The account holder is being authenticated to verify account ownership at the time of adding a card in the consent requestor system</p> <p><b>NOTE: In the context of MDES - token might be in an active state.</b></p> <p>02 VERIFY_ACCOUNT - The account holder is being authenticated to verify account ownership to use a service</p> <p>03 OTHER -</p> <p>04 PAYMENT_TRANSACTION - The account holder is being authenticated to initiate a payment transaction</p> <p>05 TOKEN_BINDING - The account holder is being authenticated to bind a token to bind ID.</p> <p>06 ACCOUNT_BINDING - The account holder is being authenticated to bind associated account with bind ID (device).</p> <p>The data of this field is a hex-encoded bitmap, whereby each bit corresponds to a specific Reason Code. The bitmap is big-endian with the least significant bit corresponding to Reason Code 01, with the next least significant bit corresponding to Reason Code 02 and so on. For example, if Reason Codes 01, and 02 the bitmap would be 0000000000000000000011 and the hex value of this field would be 000003.</p> <p><b>NOTE: This parameter is present only if an issuer has opted for Authentication Service for Click to Pay and Secure Card on File Tokens.</b></p> |
| 11       | Token Unique Reference | ans-48, left-justified, padded with spaces | Service-allocated unique reference to the token.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| 7 = Masked voice call phone number                                                                                                     |
| The "7" will be followed by the masked voice call phone number.                                                                        |

## Tokenization Complete Notification

The following table provides the technical details of DE 120 (Record Data) when DE 60 (Advice Reason Code), subfield 1 (Advice Reason Code) contains the value 141 (Mastercard Digital Enablement Service Advice to Issuer) and DE 60, subfield 2 (Advice Detail Code) contains the value 0251 (Tokenization Complete Notification) in the Administrative Advice/0620 message.

Absolute positioning of data in DE 120 subfields is required. Subfields not containing values will be populated with spaces when they are followed by subfields that contain values. If one or more subfields at the end of the data element do not contain a value the subfield(s) will not be present and the total length of DE 120 will be reduced by the subfield length(s).

### Tokenization Complete Notification

| Field ID | Field Name                            | Attributes | Values/Comments                                                                                                                                                                                                                                                        |

**NOTE: The Token Requestor ID is already being included in DE 120, field ID 7 of the Administrative Advice/0620—Issuer Token Notification Advice for Tokenization Complete Notification message.**

## Tokenization Event Notification

The following table provides the technical details of DE 120 (Record Data) when DE 60 (Advice Reason Code), subfield 1 (Advice Reason Code) contains the value 141 (Mastercard Digital Enablement Service Advice to Issuer) and DE 60, subfield 2 (Advice Detail Code) contains the value 0252 (Tokenization Event Notification) in the Administrative Advice/0620 message.

Absolute positioning of data in DE 120 subfields is required. Subfields not containing values will be populated with spaces when they are followed by subfields that contain values. If one or more subfields at the end of the data element do not contain a value the subfield(s) will not be present and the total length of DE 120 will be reduced by the subfield length(s).

## Tokenization Event Notification

| Field ID | Field Name                    | Attributes | Values/Comments                                                                                                                                                                                                                           |
|----------|-------------------------------|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 20       | Digital Service Provider ID 2 | an-5       | Contains the alphanumeric value that identifies the Digital Service Provider type and entity. This field provides information on either the third-party entity that facilitated a tokenized transaction or the entity that authenticated. |
| 21       | Cardholder Verification       | an-5       | Contains an alphanumeric value to indicate the cardholder will be authenticated and specifies the Cardholder Verification Method (CVM) will be used to authenticate the cardholder during a contactless or remote commerce transaction.   |
| 22       | Authentication Factors        | an-5       | Contains the alphanumeric value that identifies the authentication factors will be used to authenticate the cardholder during a contactless or remote commerce transaction.                                                               |
| 23       | Binding ID                    | ans-48     | The unique and fixed identifier to a component of data bound to the credential.                                                                                                                                                           |

## Administrative Advice/0620 - Issuer Token Notification Advice

Mastercard will support new layouts for Administrative Advice/0620 messages to communicate activation codes to issuers in support of token issuance and to notify issuers that Mastercard has assigned a token on their behalf. Following is a list of the data elements and values applicable to this message type. All mandatory Administrative Advice/0620 - System-generated data elements apply.

### Administrative Advice/0620 - Issuer Token Notification Advice

| Data Element and Name                     | Org | Sys | Dst | Values/Comments                                                                              |
|-------------------------------------------|-----|-----|-----|----------------------------------------------------------------------------------------------|

## MDES for Merchants

This section describes enhancements to the Mastercard Digital Enablement Service (MDES) for merchants program that provides a network tokenization service for merchants. The section provides the technical requirements for issuers choosing to participate in the program and for acquirers supporting merchants that are enrolled in the program.

Mastercard offers specific values to existing data elements in the Dual Message Authorization System to help acquirers and issuers identify the MDES for merchants program and participants throughout the authorization flow.

The following process explains an authorization transaction request when a token transaction is generated by an MDES for merchant participant.

1. When a merchant initiates the token transaction, the tokenized transaction data is transmitted to the acquirer.
2. The acquirer initiates an Authorization Request/0100 message containing the following data and sends it to the Mastercard Network for initial purchase:
  - DE 2 (Primary Account Number [PAN]) with the token
  - DE 22 (POS Entry Mode), subfield 1 (POS Terminal PAN Entry Mode), value 10 (Credential on File)
  - DE 48 (Additional Data: Private Use), subelement 42 containing value 246 indicating Merchant Risk Management Decisioning
  - DE 48 (Additional Data: Private Use), subelement 43 (Universal Cardholder Authentication Field [UCAF]) with cryptographic data
  - DE 61 (Point of Service [POS] Data), subfield 3 (POS Terminal Location)
    - Value 2 (Off premises), or
    - Value 4 (On premises of acceptor facility [cardholder terminal including home PC, mobile phone, PDA])

Acquirers submit a merchant-initiated Authorization Request/0100 message containing the following data:

- DE 2 (Primary Account Number [PAN]) with the token
  - DE 22 (POS Entry Mode), subfield 1 (POS Terminal PAN Entry Mode), value 10 (Credential on File)
  - DE 48 (Additional Data: Private Use), subelement 42 (Electronic Commerce Indicators), subfield 1 containing values:
    - Position 1, value 2 (Channel)
    - Position 2, value 4 (Digital Secure Remote Payment [DSRP] with UCAF data)
    - Position 3, value 7 (Merchant-initiated transaction)
  - DE 48 (Additional Data: Private Use), subelement 43 not present
  - DE 61 (Point-of-Service [POS] Data), subfield 3 = 2 (Off premises of acceptor facility [cardholder terminal including home PC, mobile phone, PDA])
  - DE 61 (Point-of-Service [POS] Data), subfield 4 = 4 (Standing order/recurring transactions) for recurring payment transactions or = 5 (Electronic order [home PC, Internet, mobile phone, PDA]) for partial shipments.
3. The Dual Message Authorization System attempts to identify a PAN mapping relationship between the token sent by the acquirer, and a PAN in the PAN mapping database.
    - If the mapping or validation fails, MDES rejects the transaction back to the acquirer and merchant with the appropriate response, and then generates an Authorization Advice/0120 response message to inform the issuer of the action.
    - If the MDES services are successful, the Dual Message Authorization System sends the issuer the authorization transaction request containing:
      - DE 2 (Primary Account Number [PAN]) with the cardholder's primary account number
      - DE 14 (Date, Expiration) with the primary account number's expiration date

- DE 22 (Point-of-Service [POS] Entry Mode), subfield 1, value 10 (Credential on File)
- DE 48 (Additional Data: Private Use), subelement 26 (Wallet Program Data), subfield 1 (Wallet Identifier) value = 327
- DE 48 (Additional Data: Private Use), subelement 30 (Token Transaction Identifier)
- DE 48 (Additional Data: Private Use), subelement 33 containing:
  - Subfield 1 (Account Number Indicator), value H (Cloud-Based Token)
  - Subfield 2 (Account Number) containing the token
  - Subfield 3 (Expiration Date) containing the token expiration date
  - Subfield 5 (Token Assurance Method) static value 00 to 99
  - Subfield 6 (Token Requestor ID)
  - Subfield 8 (Storage Technology)
- DE 48 (Additional Data: Private Use), subelement 42 (Electronic Commerce Indicators), subfield 1 containing value 246 indicating Merchant Risk Management Decisioning
- DE 48 (Additional Data: Private Use), subelement 42 (Electronic Commerce Indicators), subfield 1 containing value 247 for merchant-initiated transactions

**NOTE: The Dual Message Authorization System will validate or modify to the correct security level indicator (SLI) if needed. See the following for more details.**

- DE 48 (Additional Data: Private Use), subelement 43 (Universal Cardholder Authentication Field [UCAF]) may be present if the issuer has opted-in to receive cryptographic data
  - DE 48 (Additional Data: Private Use), subelement 71 (On-behalf Services) including:
    - 50C = MDES PAN Mapping service
    - 61V = MDES Pre-Validation Service for Cloud and Static tokens (ICC, DSRP, or DTVC data)
4. The issuer responds with Authorization Request Response/0110 message. The Dual Message Authorization System provides the response to the acquirer containing the following:
- DE 2 (Primary Account Number [PAN]) contains the token
  - DE 48 (Additional Data: Private Use), subelement 33, containing:
    - Subfield 1 (Account Number Indicator), value M (Primary Account Number)
    - Subfield 2 (Account Number)
    - Subfield 3 (Expiration Date) containing the expiration date
    - Subfield 5 (Token Assurance Method) static value 00 to 99
    - Subfield 6 (Token Requestor ID)
5. The acquirer forwards the Authorization Request Response/0110 including the token to the merchant.

## Mastercard Fraud Scoring Services

This section describes the Mastercard Fraud Scoring Services, which includes Fraud Rule Manager.

### Fraud Rule Manager

Fraud Rule Manager is an optional service that allows participating issuers to publish and enact business rules specific to their portfolio of accounts. Fraud Rule Manager enables issuers to automate precise, highly variable fraud decisions during authorization to respond to evolving fraud trends quickly and easily.

For more information on the Mastercard Fraud Scoring Services, refer to [Mastercard Security Solutions Guide for Issuer Services](#).

## Mastercard Identity Check

The Mastercard Identity Check™ program encompasses varying solution-oriented protocols that build upon the infrastructure requirements for channel encryption with the additional benefit of cardholder authentication. When used with components of the Mastercard Dual Message Authorization System, this program provides a mechanism for online merchants to potentially receive an enhanced payment guarantee similar to what retailers receive with qualifying physical point-of-sale transactions.

When participating in the Mastercard Identity Check program, the SLI and UCAF data must be included in the authorization to the issuer when it is available in DE 48 (Additional Data: Private Use), subelement 42 (Electronic Commerce Indicators) and 43 (Universal Cardholder Authentication Field [UCAF]). It is a variable length (maximum 32 characters) field with a flexible data structure that can be tailored to support the needs of issuer security and authentication approaches. Mastercard AAV UCAF data is always a base64 value with a length of 28 characters.

For more information on the Mastercard Identity Check program, refer to the *Mastercard Identity Check Program Guide*.

## Mastercard In Control services

The Mastercard In Control™ platform provides a number of advanced authorization, transaction routing, and alert notification capabilities designed to assist issuers in creating new and enhanced payment products for their consumer and commercial cardholders.

Mastercard In Control fully integrates patented payment technologies with unparalleled global processing capabilities. With the integration of this capability into the Dual Message Authorization System, issuers can benefit from cost efficiencies and speed to market for new product development.

For more information, refer to the [Mastercard In Control Program Guide](#), [Mastercard In Control for Mobile Payments Issuer Implementation Guide](#), [Mastercard In Control for Business Travel](#), and [Mastercard In Control for Commercial Payments Quick Start Guide](#).

## Mastercard In Control Purchase Controls

The Mastercard In Control™ Purchase Controls service allows cardholders to establish spend control rules for their pre-existing payment cards that are enforced during the authorization process.

## Mastercard In Control Real Card Spend Control services

The Mastercard In Control™ Real Card Spend Control service targets the consumer cardholder segment and offers a broad suite of authorization control categories that provide increased security and budgetary monitoring capabilities coupled with an optional Short Message Service (SMS) alerting service.

### Authorization processing

**NOTE: Spend control rules can only be applied to transactions that flow through the Mastercard Network. Spend control rules are not applied to Authorization Advice/0120: Acquirer-generated and Reversal Request/0400 messages.**

1. The acquirer sends the Authorization Request/0100 message containing the Mastercard In Control real card number in DE 2 (Primary Account Number [PAN]) to the Dual Message Authorization System.
2. The Dual Message Authorization System sends the transaction to Mastercard In Control for verification against the cardholder's registered spend control rules.

## Mastercard In Control Virtual Card Mapping and Spend Control Service

The Mastercard In Control™ Virtual Card Mapping and Spend Control Service is for cardholders to request a virtual card number, optionally establish spend controls on that virtual card, and receive alerts.

Mastercard In Control Virtual Card Mapping and Spend Control Service Authorization Request/0100 messages are identified by:

- DE 2 (Primary Account Number [PAN]) contains the real card number
- DE 48 (Additional Data: Private Use), subelement 33 (PAN Mapping File Information) contains the virtual account data
- DE 48 (Additional Data: Private Use), subelement 71 (On-Behalf Services) contains the on-behalf service performed on the transaction

The following information describes exception processing for a Mastercard In Control Virtual Card Mapping and Spend Control Service Authorization Request/0100 message that was declined by In Control processing. Other possible scenarios for a virtual card number and virtual card number with spend controls are also described.

## Mastercard Consumer Controls

Consumer Controls allows issuers to offer their cardholders popular transaction alerts and controls.

Issuers can implement alerts and controls quickly for their cardholders based on:

- Transaction amount
- Channel (for example, ATM or online)
- Country in which a transaction originates (as in, cardholders may opt-in to alerts and controls for cross-border transactions)
- Static geographic location (include/exclude specific countries)
- Acceptor business code (MCC) (single MCC or multiple MCCs)
- Budget limits
- Travel (included and excluded countries between valid to and valid from dates)

Also, cardholders can:

- Opt-in to receive alerts for all transactions.
- Disable their card to stop (decline) all payments or transactions temporarily, excluding recurring payments.
- Set decline controls based on any combination of transaction amount, channel, country in which a transaction originates, static geolocation, or MCCs.

For more information on Consumer Controls, refer to the [Consumer Controls Program Guide](#) and the [Consumer Controls Product Application Specifications Guide](#).

## Mastercard In Control Virtual Card Service

The Mastercard In Control Virtual Card Service allows issuers to process partial approvals.

Issuers must opt-in to the Mastercard In Control Virtual Card Service when choosing to process partial approvals by registering with Mastercard.

## Authorization Request/0100: In Control Purchase Control

The following is a list of the data elements and values applicable to this message type. All mandatory Authorization Request/0100 data elements apply. This layout applies to participating issuers only.

### Data elements

| Data Element                  | Org | Sys | Dst | Values/Comments                               |

## Mastercard In Control Real Card Spend Control

The Mastercard In Control Real Card Spend Control service allows cardholders to establish spend control rules for their preexisting payment cards to be enforced during the authorization process.

These rules can be defined for both card-present and card-not-present transaction environments, and depending on the cardholder's predefined response rules, may result in an alert notification being generated to the cardholder or the transaction being declined on their behalf.

**NOTE: Spend control rules can only be applied to transactions that flow through the Mastercard Network. Spend control rules are not applied to Authorization Advice/0120: acquirer-generated and Reversal Request/0400 messages.**

## Processing a Mastercard In Control service-eligible transaction

This process describes the stages of the Dual Message Authorization System processing for a Mastercard In Control Service-eligible transaction.

The acquirer sends the Authorization Request/0100 message containing the Mastercard In Control real card number in DE 2 (Primary Account Number [PAN]) to the Mastercard Network.

## Mastercard In Control Virtual Card Mapping and Spend Control Service

The Mastercard In Control platform leverages the same authorization and clearing data elements for mapping virtual card numbers to their real card account numbers as in the Mastercard In Control Purchase Control service and the Mastercard Contactless Mapping service. Issuers currently supporting the Mastercard Contactless Mapping service need only to recognize new data values in existing data elements to support the Mastercard In Control Virtual Card Mapping and Spend Control service.

### Authorization Request/0100: In Control Virtual Card Mapping and Spend Control Service

Following is a list of the data elements and values applicable to this message type. All mandatory Authorization Request/0100 data elements apply.

#### Data elements

| Data Element                                                                      | Org | Sys | Dst | Values/Comments                                    |
|-----------------------------------------------------------------------------------|-----|-----|-----|----------------------------------------------------|
| DE 2 (Primary Account Number [PAN])                                               | M   | .   | M   | The real card number                               |
| DE 48 (Additional Data—Private Use), Subelement 33 (PAN Mapping File Information) | .   | X   | C   | The virtual account data                           |
| DE 48, Subelement 71                                                              | .   | X   | C   | The on-behalf service performed on the transaction |

### Exception Processing

The following message flow describes the Dual Message Authorization System processing for a Mastercard In Control Virtual Card Mapping and Spend Control service authorization transaction that was declined by In Control processing.

1. The acquirer sends an Authorization Request/0100 message to the Dual Message Authorization System containing the In Control virtual card number in DE 2 (Primary Account Number [PAN]).
2. The Dual Message Authorization System applies unique controls for the In Control virtual card number and performs mapping to the cardholder's primary account number.
3. If the transaction fails mapping:
  - The Dual Message Authorization System declines the Authorization Request/0100, Authorization Advice/0120, or Reversal Request/400 message and sends the acquirer an

- Authorization Request Response/0110, Authorization Advice Response/0130: system-generated, or a Reversal Request Response/0410 message.
- If the transaction fails spend controls, the Dual Message Authorization System declines the Authorization Request/0100, Authorization Advice/0120, or Reversal Request/400 message and sends the acquirer an Authorization Request Response/0110 message.
4. If the transaction fails spend controls but PAN mapping is successful, the Dual Message Authorization System sends an Authorization Advice/0120: system-generated message to the issuer containing:
- DE 2 (Primary Account Number [PAN])
  - DE 48 (Additional Data: Private Use), subelement 33 (PAN Mapping File Information)
  - DE 48 (Additional Data: Private Use), subelement 71 (On-Behalf Services), subfield 1 (On-Behalf Services), value 17 (In Control Virtual Card Service) and subfield 2 (On-Behalf [OB] Result 1) containing the appropriate result value
  - DE 60 (Advice Reason code), subfield 1 (Advice Reason Code) = 200 (In Control Processing Advice to Issuer), subfield 2 (Advice Detail Code) = appropriate advice reason code

## Mastercard In Control Authorization reports

The following reports provide information about the Mastercard In Control service.

- The Authorization Parameter Summary Report (SI737010-AA) includes a Mastercard In Control Mapping participant parameter and a Mastercard In Control Real Card Spend Control participant parameter indicate issuer account range participation in the Global Parameters section.
- The Daily Account File Activity Report (AM700010-EE) displays activity associated with Mastercard In Control.
- The Detail Account Report (AM730010-AA) displays Mastercard In Control accounts.

For a sample of the Authorization Parameter Summary Report (SI737010-AA), refer to [Reports and files](#). For a sample of the Daily Account File Activity Report (AM700010-EE) and Detail Account Report (AM730010-AA), refer to the [Account Management System User Manual](#).

## Mastercard Installment Payment Service

The Mastercard Installment Payment Service is a service offered by Mastercard to Dual Message Authorization System-connected issuers to support installment payments for authorization and clearing processing. This service enables cardholders to choose to pay for a purchase in installment payments and select the installment payment terms from choices provided at the time of purchase.

For additional guidance on the Mastercard Installment Payment Service, refer to the [Mastercard Installments Payment Services Program Guide](#).

## Mastercard Merchant Presented QR

This service offers a mobile payment option for person-to-merchant transactions in markets where conventional transactions rely heavily on cash for retail purchases.

Mastercard Merchant Presented QR is a consumer-initiated, push payment transaction initiated with a mobile device. Using a smartphone, the consumer makes a cashless payment by scanning a Mastercard Merchant Presented QR code at any merchant accepting Mastercard Merchant Presented QR transactions. This product fulfills the need to make payments instantly to merchants in a direct, convenient, and secure method for both the merchant and cardholder.

This service operates in the four-party business model, which enables funds to be transferred from a licensed Mastercard Originating Institution (OI), the consumer's bank, to a Receiving Institution (RI), the merchant's bank. The transaction originates at the OI and routes to the merchant after successfully authenticating and authorizing the debit from the consumer's account. The RI will process the payment transaction and notify the merchant that the payment has been received successfully. The RI will credit the merchant account after processing the payment transaction.

For more information about Mastercard Merchant Presented QR, refer to the [Mastercard QR: Send Program Guide](#).

## Dual Message Authorization System Edits

The Dual Message Authorization System performs the following system edits.

### Mastercard Merchant Presented QR Funding Transaction Processing

The Dual Message Authorization System validates Mastercard Merchant Presented QR transactions that are identified as:

- DE 3 (Processing Code), subfield 1 (Cardholder Transaction Type Code), value 00 (Purchase)
- DE 48 (Additional Data), subelement 77 (Transaction Type Identifier), value C67 (Mastercard Merchant Presented QR)

### Mastercard Merchant Presented QR Payment Transaction

The Dual Message Authorization System validates Merchant Presented QR Payment transactions that are identified as:

- DE 3 (Processing Code), subfield 1 (Cardholder Transaction Type Code), value 28 (Payment Transaction)
- DE 48 (Additional Data), subelement 77 (Funding/Payment Transaction Type Identifier), value C67 (Masterpass QR)

The Dual Message Authorization System validates Merchant Presented QR Refund Payment transactions that are identified as:

- DE 3 (Processing Code), subfield 1 (Cardholder Transaction Type Code), value 28 (Payment Transaction)
- DE 48 (Additional Data), subelement 77 (Funding/Payment Transaction Type Identifier), new value C68 (Masterpass QR Refund)

## Alternate Processing

If the receiving institution is unable to respond, Mastercard Merchant Presented QR transactions are declined.

If the Mastercard Merchant Presented QR Blocking Service is not available:

- The platform that called the service receives notice that the service is not available. The following information is sent to the Receiving Institution in the Authorization Request/0100 message for an authorization decision.
  - DE 48 (Additional Data: Private Use), subelement 71 (On-behalf Service), subfield 1 (On-behalf Service Indicator), value 37 (Mastercard Merchant Presented QR Blocking Service)
  - DE 48, subelement 71, subfield 2 (On-behalf Result 1), value U (Unable to process)

### Alternate Processing for Refund Payment Transactions

If the consumer's bank is unable to respond to a payment or refund payment request, the Mastercard Merchant Presented QR refund transaction is declined.

Stand-In limits are set to zero.

### X-Code Processing

Mastercard Merchant Presented QR transactions is declined by the Dual Message Authorization System in X-Code Processing with DE 39 (Response Code), value 91 (Authorization System or issuer system inoperative).

For more information about Mastercard Merchant Presented QR, refer to the [Mastercard QR: Send Program Guide](#).

## Mastercard Send programs

Mastercard Send includes the Mastercard Send Payments Transaction program, the Mastercard Funding Transaction program, and the Mastercard Gaming and Gambling Payments program.

The Mastercard Send programs allow processing of funding and payments transactions on the Dual Message Authorization System to facilitate various money transfer and remittance flows globally for person to person, person to merchant, business to consumer and business to business processing. Consumers can leverage their Mastercard®, Debit® Mastercard®, Cirrus®, or Maestro® card to send and access funds for both domestic and cross-border transactions. Funding and payment transactions can be enabled through multiple channels such as an ATM, a bank branch, a stand-alone kiosk, mobile, or remote.

### Mastercard Funding Transaction program

The funding transaction program facilitates both intracountry and cross-border funding transactions from Mastercard, Maestro, and Cirrus-branded cards.

A funding transaction is a point-of-sale (POS) transaction for the purchase of funds transfer services that involves the transfer of funds from an eligible account (by an acquirer or an originating institution on behalf of the cardholder or the sender) for the purpose of either: (a) funding a subsequent transactions and linking funds transfer from the Sender to another person or entity; or (b) transferring funds into another eligible financial account held by that sender.

### Mastercard Send Payment program

The Mastercard Send Payment program enables person-to-person transfers, account-to-account transfers, agent cash out, credit card bill payment, business to consumer disbursement, government/non-government organization to consumer disbursement, and business money transfers by allowing consumers to use their Mastercard, Debit Mastercard, Cirrus, or Maestro card to send and access funds. The Mastercard Send Payment program also allows the use of multiple channels to initiate transactions such as an ATM, a bank branch, a stand-alone kiosk, mobile phone, or over the Internet.

### Mastercard Gaming and Gambling Payments program

A gaming payment transaction is a type of payment transaction that transfers winnings or value usable for gambling or gaming to a Mastercard or Maestro account. It is affected pursuant to, and subject to, the Gaming and Gambling Payments Standards. The funds are transferred by an Originating Institution, or an acquirer, to the recipient's receiving account at the Receiving Institution, or an issuer. Gaming payment transactions serve the growing demand by originating institutions and receiving institutions for fast, secure, and convenient ways for customers to send and receive gaming payments, respectively.

For a list of countries that process and receive Gaming and Gambling payment transactions, refer to [Mastercard Gaming and Gambling Payments Program Standards](#).

For a list of MCCs supported under the Gaming and Gambling program, refer to [Mastercard Gaming and Gambling Payments Program Standards](#).

### Gaming and gambling payment transaction identification

For more information about implementing the Mastercard Send Payment Transaction Program and Gaming and Gambling Payments Program, refer to the [Mastercard Send and Funding Transactions Program Standards](#) or contact the Global Customer Service team.

## Authorization Request/0100: Mastercard Funding Transactions

Originating Institutions (OIs) that are registered for the Mastercard Funding Transaction program will be required to send an Authorization Request/0100 and Reversal Request/0400 message with the required data elements in addition to the data elements that are specific to this service.

### Applicable data elements

Following is a list of the data elements and values applicable to this message type. All mandatory Authorization Request/0100 data elements apply.

## Authorization Request/0100: Mastercard Send payment transactions

Originating Institutions (OIs) that are registered for the Mastercard Send Payments Transaction program are required to send Authorization Request/0100 and Reversal Request/0400

messages with the required data elements in addition to the data elements that are specific to this program.

### Applicable edits

The following table is a list of the data elements and values applicable to this message type. All mandatory Authorization Request/0100 data elements apply.

## Mastercard MoneySend Issuer Transaction Controls

The Mastercard® MoneySend™ Issuer Transaction Controls is an On-behalf Service that Receiving Institutions can use to manage their risk. Monitoring and blocking options include velocity by number of transactions and cumulative dollar amount, and sanctions score.

## Network Blocking

Mastercard sets single transaction amounts and 30-day accumulative amount limits to receiving accounts for Mastercard Send Payment, Gaming and Gambling payment transactions. The maximum amount limit for single transactions and 30-day accumulative amount limits vary by program type. Mastercard declines transactions over the set limits with DE 39, value 05 (Do not honor).

## Sanctions Scoring

Mastercard provides a Sanctions Scoring service to assist with meeting Anti-Money Laundering (AML) obligations.

**NOTE: Mastercard has suspended the Mastercard Send Sanctions Scoring Service effective 30 April 2021. Customers will be advised accordingly should Mastercard reinstate the service at a later date.**

The sanctions score is provided to acquirers and issuers and is available for all cross-border Mastercard Send Payment transactions and intracountry Mastercard Send payment transactions in Egypt, Canada, across Europe, and the U.S. This service provides a score based

on screening the individual sender name (consumer, business, government, and non-government) in the authorization message to support real-time decision making.

## Stand-In Authorization and X-Code Processing

Mastercard Send payment and Gaming and Gambling payment transactions are declined by Stand-In Authorization and X-Code Processing. Mastercard Send funding transactions are evaluated against limits and processing in accordance with the issuer Stand-In limits or X-Code controls pertinent to the applicable information in the message (such as Brand, MCC, Purchase (DE 3 = 00), and so forth).

## Mastercard Send payment transaction blocking criteria

The Dual Message Authorization System supports transaction blocking for Mastercard® payment transactions at the country and Receiving Institution (RI).

Transaction blocking may occur at the following levels:

- Country level: When Mastercard has determined that processing through Mastercard Send is not supported in a particular country, the Dual Message Authorization System automatically declines all Mastercard Send payment transaction authorization requests sent to or received from that country.
- Receiving financial institution level: When Mastercard has determined that an RI or associated RI account range is not eligible to process transactions through Mastercard Send, the Dual Message Authorization System automatically declines all Mastercard Send Payment Transaction authorization requests with that RI.

### Block all transactions

Mastercard has enhanced the On-Behalf opt-in service Mastercard Send Issuer Transaction controls service by adding a control to block all Mastercard Send payment and funding transactions. The Block All control is limited to issuers on a case-by-case basis and only available upon request. The block all control will deny all the Mastercard Send Payment and Funding authorization transactions that are submitted in both the Dual Message Authorization System for specific account ranges.

### Authorization report

The Authorization Parameter Summary Report (SI737010-AA) includes a Mastercard Send Blocking flag in the Global Parameters section that identifies whether an RI's account range is blocked from processing transactions through the Mastercard Send platform.

For a sample of the Authorization Parameter Summary Report (SI737010-AA), refer to [Reports and files](#).

## Mastercard Send Issuer Transaction Controls

The Mastercard® Issuer Transaction Controls is an on-behalf service that Receiving Institutions can use to manage their risk. Monitoring and blocking options include velocity by number of transactions and cumulative dollar amount, along with sanctions score.

## Mastercard Pay By Account Program

The Mastercard® Pay by Account for retail payments (referred to as Pay by Account Program) helps issuers, referred to as Account Holding Institutions (AHIs) such as banks, credit unions, and digital players, enrolled in the Pay by Account Program, accelerate the digital transformation of everyday payments by offering consumers additional payment choices, using a secure retail payment solution.

The Pay by Account Program is designed to function as a traditional Debit Mastercard to leverage the Mastercard global acceptance network across in-store (contactless and QR) and e-commerce channels.

The Pay by Account Program enables:

- Account holders to use a digital account-based payment solution through an AHI's online and mobile platforms to process retail transactions. The solution enables an account holder to select an eligible consumer account to make a payment to a merchant across a range of use cases including online, in-app, and in-store purchases; and
- A merchant, through its acquirer, which is referred to as an Acquiring Institution, enrolled in the Pay by Account Program to (1) opt-in and receive real-time settlement of the merchant's proceeds from the Acquiring Institution or (2) process the transaction as a Debit Mastercard transaction and receive settlement of the merchant's proceeds from the Acquiring Institution through its usual processes for the Dual Message Authorization System.

### To Participate

Acquiring Institutions and AHIs that choose to participate in the Mastercard Pay by Account Program must register by contacting their Mastercard account representative or Global Customer Service.

## MCC 106: MDES PAN Mapping File

Account Holding Institution (AHI) can request two distinct types of maintenance for Mastercard Pay by Account tokens stored in the MDES PAN Mapping File: Token status changes and financial account information replacement.

Requests for Mastercard Pay by Account token record maintenance are made using the Issuer File Update Request/0302 message. This message meets all the general message requirements and the following Mastercard Pay by Account requirements:

- DE 2 (Primary Account Number) must not be present
- DE 91 (Issuer File Update Code) must contain value 2 (Update)

- DE 101 (File Name) must contain the value MCC106 (MDES PAN Mapping File)
- DE 120 must be present and formatted as described in the following table

### Field values

| Field ID | Field Name             | Attributes | Comments/Valid Values                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## Mastercard Payment Gateway

The Mastercard Payment Gateway (Payment Gateway) is a Mastercard hosted, centralized, modular gateway for routing commercial payments between buyers and suppliers.

**NOTE: Applies only to the U.S. region.**

The Payment Gateway collects, transforms, and routes commercial payment instruction orders. The Payment Gateway accepts files containing payment instructions and remittance advice information from commercial buyers. Payment instructions are generated directly from the buyer's Enterprise Resource Planning (ERP) or Accounts Payable system.

### Benefits

Key features of the Payment Gateway include:

- Data translation and routing
- Bank connectivity that is available anywhere and anytime
- Universal supplier directory
- Remittance advices to buyers and suppliers
- Payment views and reports
- Straight Through Payment Processing
- Web-based portal

### How it works

The Payment Gateway supports two payment types:

- Payables Account (virtual Purchasing Card) payments
- Electronic Funds Transfer (EFT) payments

The authorization blocking feature supports Payables Account (virtual Purchasing Card) payments only.

The Payment Gateway does not replace the financial institution's existing commercial payment offerings. Rather, it provides the entryway for receiving a buyer's payment files, thus providing a single destination or interface for business-to-business payment processing. In this way, Mastercard does all the work of file translation and data mapping, but the actual payment processing remains the domain of the financial institutions.

The Payment Gateway uses a modular approach. Financial institutions can market and package distinct modules to augment their existing payment services.

Issuers that offer commercial cards may choose to restrict the authorization of certain account ranges to occur through the Payment Gateway by participating in the Mastercard Payment Gateway Authorization Blocking service.

The Dual Message Authorization System determines whether to continue processing or reject Payment Gateway authorization requests based on the presence of DE 48 (Additional Data: Private Use), subelement 47 (Mastercard payment Gateway Transaction Indicator), value MC-MPG/W and the issuer's participation in the Mastercard Payment Gateway Authorization Blocking service.

### **Authorization reports**

The Authorization Parameter Summary Report (SI737010-AA) includes a Mastercard Payment Gateway participant parameter in the Global Parameters section, which indicates when an issuer participates in the Mastercard Payment Gateway Authorization Blocking service. For a sample of this report and field descriptions, refer to [Reports and files](#).

### **Mastercard Payment Gateway Authorization Blocking service**

The Mastercard Payment Gateway Authorization Blocking service allows issuers to restrict the authorization of transactions to only those originating from the Mastercard Payment Gateway platform.

## **Mastercard Safety Net**

This section provides a brief overview of the Mastercard Safety Net service, part of the Mastercard Global Safety and Security Standards suite of services.

### **Summary and Background**

Mastercard Safety Net provides issuers with a second line of defense to limit the impact of a large-scale fraud attack on one or more of their payment channels (for example, in ATM or e-commerce) when their payment systems are breached. The service also identifies when large-scale fraud attacks are occurring, using insights from the Mastercard Network, so that appropriate action can be taken by the issuer. It does not replace an issuer's primary fraud prevention system.

As applicable, Mastercard requires issuers to participate in Mastercard Safety Net across their entire consumer and commercial credit and debit portfolios, without the availability of an opt-out.

Issuers may enroll in the Mastercard Safety Net Alert Only option if desired through **Manage My Accounts** in Mastercard Connect™.

### Data Requirements

If a transaction is declined by the Safety Net service, issuers will receive an Authorization Advice/0120 message with the following values:

- DE 48, subelement 71, subfield 1 = 18 (Fraud Scoring Service)
- DE 48, subelement 71, subfield 2 = C (Fraud Scoring Service was performed successfully)
- DE 48, subelement 75, subfield 1 = 998 or 000
- DE 48, subelement 75, subfield 2 = NM (Network Monitor)
- DE 60, subfield 1 = 120 (Transaction Blocking)
- DE 121 = 000003 (Decline occurred due to an on-behalf service)

### For More Information

For more information, refer to the [Safety Net User Guide](#).

## Mastercard transit transactions

The demands of the transit environment make it different from the traditional retail payment environment.

Specifically, the transit environment requires Fast and secure access to the transit system. Control of access to the transit system (generally referred to as "permission to travel"). Ticketing, beyond simple system access, and ticket inspection establishes that the individual is authorized to take a specific trip. A flexible relationship between access and payment, as the final transaction amount is often not known until the journey is complete. Mastercard delivers on all of these requirements through a range of transit models and related business rules that support acceptance of a broad range of contactless cards.

For more information, refer to the [Mastercard Global Transit Implementation Guide](#).

## Pre-funded transit transactions

A pre-funded transit transaction occurs when the cardholder purchases value redeemable for future travel with a transit merchant. The purchased value is held by the transit merchant in an account linked to the cardholder's card or device. Any usage of the card or device following the purchase of value will reduce the value held with the transit merchant.

The transit merchant follows its usual authorization procedures by generating an Authorization Request/0100 message for the full amount of the transaction.

## Real-time authorized transit transactions

A real-time authorized transit transaction occurs when the transit merchant generates an Authorization Request/0100 message each time a cardholder uses his or her card or device at the transit merchant's terminal.

The transit merchant follows its usual authorization procedures by generating an Authorization Request/0100 message for the full amount of the transaction.

## Post-authorized aggregated contactless transit transactions

A post-authorized aggregated contactless transit transaction occurs when the transit merchant generates a First Presentment/1240 message combining one or more contactless taps performed with one contactless account number and occurring with one transit merchant.

For the contactless transit merchant to receive chargeback protection all of the following must occur:

- The transit merchant must send a properly identified Authorization Request/0100 message, which can be for any amount not exceeding the cardholder verification method (CVM) limit amount, as published in the *Chargeback Guide* on the day of the transaction.
- The issuer must have approved the transaction.
- The combined amount of the contactless taps must be equal to, or less than, the cardholder verification method (CVM) limit amount, as published in the *Chargeback Guide*.
- The maximum time period from the first contactless tap until the First Presentment/1240 message is generated must be 14 calendar days or less.

**NOTE: These transit transactions are limited to MCCs 4111, 4131, and 4784.**

Upon the cardholder's request, the transit merchant must provide a list of the contactless taps that were combined into a First Presentment/1240 message.

**NOTE: The phrases "tap the contactless card or device" and "contactless tap" refer to the same series of actions: a cardholder touching the contactless card or device to a contactless terminal, the contactless terminal reading the card data, and then the contactless terminal flashing a light and making a sound to indicate the outcome of the tap to the cardholder.**

## Authorized-aggregated split clearing transactions

An authorized-aggregated split clearing transaction is subject to the following restrictions.

**NOTE: Applies only to domestic United Kingdom (U.K.) transactions.**

- The contactless-enabled card or device must indicate that an M/Chip profile is supported.
- Tag 5F28 (Issuer Country Code) must have a value of 826.

- The denominated primary currency is GBP.
- The transaction is properly identified in the same manner as described in Post-authorized Aggregated Contactless Transit Transactions, with the exception that the value in the transit indicator field is value 4, instead of value 3.

## Post-authorized aggregated Maestro contactless transit transactions

A post-authorized aggregated Maestro contactless transit transaction occurs when the acquirer generates an Authorization Request/0100 message for an estimated or maximum amount in connection with the use of one Maestro contactless account number at one transit merchant.

The transit merchant may combine multiple Maestro contactless taps into a single transaction amount and reverse any unused funds by the cardholder at the end of the aggregation time period.

The transactions are processed as follows:

- The transit merchant sends an Authorization Request/0100 (Europe-acquired only) message containing value 06 in DE 48, subelement 64, subfield 1 (Transit Transaction Type Indicator) for an estimated or maximum amount not to exceed the applicable contactless transit aggregated CVM amount.
- The issuer must have approved the transaction.
- The cardholder may make subsequent taps for additional rides. These taps will not be sent to the issuer for authorization. The combined amount of the taps must be equal to or less than the applicable contactless aggregated CVM limit amount.
- When the authorized amount is reached or within 3 calendar days (3 days in Mexico), the transit merchant totals the value of all taps and generates a partial Reversal Request/0400 or an Authorization Advice/0120 message to reverse any unused funds. The Authorization Advice/0120 message option is only available for Europe region acquirers.

The transaction is properly identified in the same manner as described in Post-authorized Aggregated Contactless Transit Transactions, with the exception that the transit transaction type identifier (DE 48, subelement 64) value is 06.

## Post-authorized aggregated Maestro contactless transit transactions criteria

All post-authorized aggregated Maestro contactless transit transactions must be identified properly.

Post-authorized aggregated Maestro contactless transit Authorization Request/0100 messages submitted by a transit merchant for Maestro contactless cards or devices must contain the following data element values.

# Differences between post-authorized aggregated and authorized-aggregated split clearing transit transaction rules

Differences between the current Mastercard post-authorized aggregated transit rule and the authorized-aggregated split clearing transit rule for U.K. transit transactions are listed in table format.

## Transaction rules

| Post-authorized Aggregated Transit Transaction Rule                                                                                                                                                                                                                                                                       | Authorized-aggregated Split Clearing Transaction Rule in the U.K.                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| The transit agency receives no chargeback protection in the event that an issuer declines the authorization.                                                                                                                                                                                                              | Extends the transit agency's chargeback protection rights to include transactions for which the authorization on a U.K. issued credit, debit or prepaid card or device is declined, provided the authorization and clearing amounts are GBP 10 or less.<br><br><b>NOTE: Cards that do not meet the criteria to be eligible for this liability protection follow the Post-Authorized Aggregated Transit Transaction Rule, that is, an overseas issuer, issuing cards not denominated in GBP would not have any additional liability.</b> |
| Each aggregation period (up to 14 days) is initiated by a single authorization and completed by a single clearing message.<br><br>The aggregation period when processing Maestro transactions will be different. Time periods range from 1-3 days, depending on the region and country the transaction is being acquired. | Accommodates the UKCA transaction model by allowing the transit agency to submit a clearing message at the end of every day on which the card incurred transit spend (subject to either an approved authorization message or a declined authorization message and the spend being up to and including GBP 10.00).<br><br>Therefore, there can be multiple clearing messages submitted between successive authorizations for the same card.                                                                                              |

## ATC update request

Authorization Request/0100 messages containing DE 61 (Point-of-Service [POS] Data), subfield 7 (POS Transaction Status), value 6 (ATC Update) are used to notify the issuer of the most recent ATC (Application Transaction Counter) value for the contactless card or device.

All ATC update authorization requests will have a zero value for the transaction amount. ATC update transactions may be sent regularly, and issuers must ensure that these transactions do not affect the issuer's velocity checks. In addition, issuers should authorize these transactions using DE 39 (Response Code), value 00 (Approved or completed successfully) or 85 (Not

declined), or decline these transactions using DE 39, value 05 (Do not honor) based on the fact that the ATC provided is within or outside of the issuer's ATC tolerance.

For approved transactions where the application cryptogram has been successfully validated, issuers should keep a record of the last seen ATC and set a feasible range. Subsequent transactions received that contain an ATC outside of this range should be treated as suspicious but should not be routinely declined.

Acquirers supporting merchants that implement the Mastercard contactless aggregated models may support zero amount Application Transaction Counter (ATC) update Authorization Request/0100 messages to notify issuers of the most recent ATC values for the offline cardholder aggregation activity.

## Transit debt recovery transactions

Transit merchants typically work solely in a prepaid environment in which the passenger purchases a ticket or a prepaid balance before travel.

With transit merchants migrating to open loop payments where the card presented for payment is also used as a token at the point of entry, there is some risk in allowing a cardholder to travel before receiving payment or even knowing if the account linked to the card being presented for travel is in good standing.

Mastercard Rules allow transit merchants to recover an amount owed to them (a transit debt recovery transaction) following a declined authorization request. A transit debt recovery transaction occurs when transit fare spend has been incurred, in granting a Mastercard contactless card access to travel, and as a result of the issuer declining the authorization request, the transit merchant is initially unable to collect payment for the fare spend. When this situation occurs, the transit merchant may add the card to a Deny List, thereby blocking that card from access to travel until such time as the money owed by the cardholder has been recovered.

A mechanism by which a cardholder's debt is cleared for the cardholder to access the transit system to resume travel is through debt recovery transactions. The Mastercard Contactless Transit Rules create the opportunity for this situation to arise:

- Post-authorized aggregated (Global)
- Authorized aggregated split clearing (U.K. and Republic of Ireland only)
- Post-authorized aggregated Maestro
- Any other transit implementation where the cardholder is allowed to travel before the authorization taking place (deferred authorization)

There are several methods of debt recovery that a transit merchant can implement and each method allows debt recovery transactions to recover a debt from a card or device. Mastercard and Maestro contactless products allow debt recovery to be performed through the following mechanisms:

- Automatically: Presented as a card-not-present (CNP)/PAN key-entered transaction
- Call Centers: Presented as a CNP/MOTO (Mail Order/Telephone Order) transaction

- Websites: Presented as a CNP/e-commerce transaction
- Ticket-vending machines and other ticket office processing: Presented as a card present transaction

## Support for U.K. transit transactions

Mastercard® and Maestro® contactless customers that choose to implement contactless cards and devices in the U.K. must process transit transactions according to the U.K. Cards Association Transit Transaction Model, published in [U.K. Domestic Rules](#).

Customers must ensure that their contactless cardholders are able to use their cards successfully for travel on public transport operated by Transport for London and other U.K. transit operators.

## PAN-association requirements for transit

Issuers that issue alternate account numbers for contactless products and respond to Authorization Request/0100 messages from MCCs 4111, 4131, 4784, and 7523 must provide the following values in DE 48 (Additional Data: Private Use), subelement 33 (PAN Mapping File Information) when sending the Authorization Response/0110 message.

- Subfield 1 (Account Number Indicator), value E (Printed Account Number Provided by Issuer)
- Subfield 2 (Account Number), embossed PAN
- Subfield 3 (Expiration Date), expiration date of the embossed PAN

For issuers participating in the Mastercard® Contactless Mapping Service, the Dual Message Authorization System will provide these values on their behalf in the authorization response messages. This helps ensure that the pre-purchased fares by cardholders using the PAN printed on the card are properly associated with their turnstile requests. This will also help ensure proper customer service.

Acquirers processing for merchants belonging to MCC 4111, 4131, 4784, and 7523 must provide the DE 48, subelement 33 details when present in the authorization response message back to the merchants belonging to these MCCs upon their request.

Refer to the [Mastercard Global Transit Implementation Guide](#) or [Transaction Processing Rules](#) for more information.

## Merchant Risk Predict

Merchant Risk Predict provides predictive, AI generated merchant fraud detection scores to acquirers on dual message authorization transactions. The seven scores sit within the authorization message to acquirers and provide immediate feedback on merchant health, compliance, and chargeback risks.

Merchant Risk Predict provides an alphanumeric code for each score within the Authorization Request Response/0110 message in authorization in DE 48, subelement 57, and is used by

acquirers. The alphanumeric code indicates the likelihood of fraud across seven different scores that provide immediate feedback on merchant health, compliance, and chargeback risks.

For more information, refer to the [Mastercard Merchant Risk Predict Program Guide](#).

## Scores and values

### Scores and values

| Score                              | Predictive insight                                                                                                                                                                          | Customer value                                                                                                                                            |
|------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| Merchant Fraud Risk                | Likelihood that merchant encounters fraudulent activities as a portion of overall business                                                                                                  | Understand merchant risk profiles for liability purposes, enforcement of higher security standards, and to evaluate business relationships with merchants |
| Ghost Merchant Risk                | Likelihood that merchant is set up temporarily to collect fraudulent transactions (new merchants only) and subsequently reports high fraud and chargeback bps within 90 days before closure |                                                                                                                                                           |
| Merchant Fraud Attrition Risk      | Likelihood of merchant attrition due to increasing fraud or chargeback in the next 3 months (for tenured merchants)                                                                         | Understand fraud liability due to future merchant inactivity risk                                                                                         |
| Merchant Alternative Identity Risk | Likelihood that a merchant is operating under an alternative category not representative of the business                                                                                    | Ensure merchant credentials are established with legitimate business purposes                                                                             |
| Merchant Account Takeover Risk     | Indicates likelihood of account takeover with fraud testing due to weak authentication and fraud prevention systems                                                                         | Understand risk for specific merchants to be breached by fraudsters                                                                                       |
| Excessive Fraud Chargeback Risk    | Likelihood that the merchant experiences excessive chargebacks as a share of total gross dollar volume (GDV) within next 3 months                                                           | Manage expected chargeback volumes related to fraud over time and take mitigating actions with merchants at highest risk and highest anticipated volumes  |
| Fraud Chargeback GDV               | Estimated revenue segment merchant is likely to owe in fraud related chargebacks in the next 3 months                                                                                       |                                                                                                                                                           |

**Threshold for review**

Acquirers can determine at which threshold they wish to evaluate the result scores. For example, a customer may choose to review only the top 10 percent highest scored merchants for each category.

**M/Chip processing services**

Mastercard provides M/Chip processing services to help issuers that want to migrate to Mastercard M/Chip technology without having to make an initial investment to completely upgrade their host systems for M/Chip processing.

The M/Chip processing services support issuers using M/Chip technology by performing all or part of the M/Chip-related authorization processing on behalf of the issuer for a designated account range.

The M/Chip processing services are available to all brands: Mastercard, Maestro, Cirrus, and Debit Mastercard. There are three M/Chip processing services:

- Chip CVC to CVC1 Conversion Service
- Chip to Magnetic Stripe Conversion
- M/Chip Cryptogram Pre-validation
- M/Chip Cryptogram Validation in Stand-In Authorization

**NOTE: All issuers globally that participate in Stand-In Authorization must have M/Chip Cryptogram Validation in Stand-In Authorization performed during Stand-In Authorization.**

The Chip to Magnetic Stripe Conversion and the M/Chip Cryptogram Pre-validation services are provided on a permanent basis. The M/Chip Cryptogram Validation in Stand-In Authorization service is provided on a dynamic basis if an issuer is not able to respond to an authorization request.

In addition to these services, issuers can combine the M/Chip Cryptogram Pre-validation Service and the Chip to Magnetic Stripe Conversion Service (referred to as the Combined Service Option).

Issuers that participate in the M/Chip Cryptogram Pre-validation service, the M/Chip Cryptogram Validation in Stand-In Authorization service, or the Combined Service Option may optionally support M/Chip Advance.

For more detailed information about these M/Chip processing services, including information about the Chip Processing Services Member Requirements and Parameters Form, refer to the [M/Chip Processing Services Service Description Guide](#).

## Chip to Magnetic Stripe Conversion

Mastercard provides Chip to Magnetic Stripe Conversion service to issuers by performing all or part of the M/Chip-related authorization processing on behalf of the issuer for a designated account range.

The Chip to Magnetic Stripe Conversion service is optional.

**NOTE: The Global Clearing Management System (GCMS) also offers the Chip to Magnetic Stripe Conversion service.**

## Chip CVC to CVC 1 Conversion service

The Chip CVC to CVC 1 Conversion service offers issuers the option of having Mastercard pre-validate the Chip CVC value and, when valid, replace it with the appropriate CVC 1 value before delivering the authorization request message to the issuer during normal authorization processing.

Pre-validation is performed to ensure that a CVC 1 value is generated only for transactions containing a valid Chip CVC. The Chip CVC to CVC 1 conversion service validates the Chip CVC value and, if valid, replaces it with the appropriate CVC 1 value before delivering the authorization request message to the issuer during normal authorization processing.

The Chip CVC to CVC 1 Conversion service is optional.

### Service options

Two service options are available to issuers:

- Single key and decision matrix for both CVC 1 and Chip CVC
- Different keys and decision matrices for CVC 1 versus Chip CVC

The service first attempts to validate the Chip CVC value using issuer-provided keys (validation is performed to help ensure that only transactions containing a valid Chip CVC are serviced). If the validation is successful, the service uses issuer-provided keys to calculate the CVC 1 value and replace the Chip CVC with the CVC 1 value.

Regardless of the Chip CVC validation result (successful or unsuccessful), the service always attempts to send the authorization request message to the issuer for an authorization decision (if the issuer is unavailable and Stand-In Authorization is enabled for the account range, the Stand-In Authorization will make the authorization decision). The service does not offer an option to decline on behalf of the issuer.

The service supports issuers with authorization host systems that do not support Chip CVC validation. Issuers may choose to use the service as part of their magnetic stripe to chip technology migration path, or as a component of their long-term chip issuance strategy.

**NOTE: Issuers that use the service must ensure CVC 1 and Chip CVC are located in the same positions of the Track 2 data, in the physical magnetic stripe Track 2 and in the Track 2 equivalent data encoded in the chip.**

**Validation of Chip CVC using issuer-provided keys**

Before generating CVC 1, the service will first attempt to validate the Chip CVC using issuer-provided keys.

**Edits**

| WHEN...                    | THEN...                                                                                                                                                                                                                                                                                                                            |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Validation is successful   | The service will generate CVC 1, which will replace the Chip CVC in the Track 1 DE 45 or Track 2 DE 35 data as applicable.                                                                                                                                                                                                         |
| Validation is unsuccessful | <p>The service will not generate CVC 1, and the Chip CVC will remain in the Track 1 DE 45 or Track 2 DE 35 data as applicable.</p> <p>Mastercard recommends that issuers include DE 48, subelement 87 (CVC Result) value "Y" (Invalid CVC 1) in the authorization response message whenever CVC 1 is determined to be invalid.</p> |

The appropriate On-behalf service IDs and service result code will be added to the message in DE 48, subelement 71.

**U.S. Chip-Enabled Travel Card program**

The U.S. Chip-Enabled Travel Card program leverages the functionality of the Chip to Magnetic Stripe Conversion service and allows issuers that participate in the Chip to Magnetic Stripe Conversion service the option not to receive notification that the conversion has taken place (service results) in authorization and financial request messages.

**Benefits**

The U.S. Chip-Enabled Travel Card program benefits include the following:

- Creates new revenue streams and greater operational efficiency
- Provides the opportunity to capture more payments in new markets, displacing many cash purchases made around the world
- Promotes the globalization of EMV chip technology

How it works

Issuers have the option not to receive notification that the Chip to Magnetic Stripe Conversion has taken place, removing the impact to their authorization and clearing systems when implementing chip. Existing functionality of the Chip to Magnetic Stripe Conversion service, as well as the Combined Service Option (Chip to Magnetic Stripe Conversion and M/Chip Cryptogram Pre-validation services) are not affected. Service results are retained by Mastercard for billing and reporting purposes.

Transactions are tracked at the account range. The source of the track data provided is from Track 2 Equivalent Data (tag 57). Issuers should be aware that the CVC value contained therein is the Chip CVC and not CVC 1; therefore, it will impact any CVC validation that an issuer performs.

For a chip transaction received for an account within the account range, the chip transaction is converted to the magnetic stripe equivalent. Although participation is set at the account range, instead of at the specific account, other accounts that the issuer does not want to participate will not be chip enabled.

Chip-enabled U.S. travel cards include a hybrid chip and magnetic stripe card with signature, as the card verification method and online PIN capabilities. Chip-enabled U.S. Travel cards allow chip acceptance and continue to function similar to existing issuer magnetic stripe cards.

Authorization processing

The following information describes the Dual Message Authorization System of U.S. chip-enabled travel cards transaction processing.

**To participate**

Issuers that want to participate in the U.S. chip-enabled travel card program must register for the Chip to Magnetic Stripe Conversion Service. In addition, issuers must contact their regional Mastercard representative to request this service and identify the account range for which the Chip to Magnetic Stripe Conversion service will support.

**M/Chip Cryptogram Pre-validation service**

The M/Chip Cryptogram Pre-validation service is for issuers that use the M/Chip Select 2.0, M/Chip Lite 2.1, M/Chip 4.0 (Mastercard, EMV CSK, and EMV2000 session key derivation methods), *M/Chip™ Advance*, and EMV CCD-compliant chip cards.

This service:

- Validates the Authorization Request Cryptogram (ARQC) and Transaction Certificate Cryptogram (TC), and generates the Authorization Response Cryptogram (ARPC) on behalf of an issuer.
- Validates critical chip information included in the Card Verification Results (CVR) and Terminal Verification Results (TVR).

After performing this service, Mastercard notifies issuers of the results of the cryptogram validation. Issuers may use these results in the authorization approval process.

The M/Chip Cryptogram Pre-validation service is mandatory.

## Decline option for issuers

Mastercard has enhanced the M/Chip Cryptogram Pre-validation service with a decline option indicator to decline transactions on-behalf of participating issuers when the Application Request Cryptogram or the chip data validation for the transaction is not successful.

For the decline option indicator, Mastercard will forward the transaction to the issuer or decline the transaction on-behalf of the issuer on the basis of the information included in the decision matrix. For each value of the On-behalf Service (OBS) results, the decision matrix includes which action to take (forward or decline the transaction).

Mastercard supports the following four options for issuers registering to the OBS 02 service.

- Option 1: Do not use the decline option for neither contact nor contactless transactions.
- Option 2: Use the decline option for contact and contactless transactions.
- Option 3: Use the decline option for contact transactions and do not use the decline option for contactless transactions.
- Option 4: Use the decline option for contactless transactions and do not use the decline option for contact transactions.

## Combined service option

Issuers can choose an option that combines the Chip to Magnetic Stripe Conversion and M/Chip Cryptogram Pre-validation services.

This option allows two M/Chip processing services to be performed on a single transaction, providing issuers with a bridge to maximize the benefits of chip card processing capabilities while minimizing impacts on their authorization systems. These two services also are available individually.

The Combined Service Option is optional.

## M/Chip Cryptogram Validation in Stand-In Authorization

M/Chip Cryptogram Validation in Stand-In Authorization is available for issuers that use the M/Chip Select 2.0, M/Chip Lite 2.1, and M/Chip 4.0 (Mastercard, EMV CSK, and EMV2000 session key derivation methods), M/Chip Advance, and EMV CCD-compliant chip cards.

**NOTE: All issuers globally that participate in Stand-In Authorization must have M/Chip Cryptogram Validation in Stand-In Authorization performed during Stand-In Authorization.**

This service authorizes M/Chip transactions within Stand-In Authorization when an issuer host is not available. When Stand-In Authorization authorizes M/Chip transactions, Mastercard validates the ARQC, TC, and critical (CVR and TVR) chip information, processes the authorization request based on the issuer's Stand-In parameters, and generates the ARPC.

M/Chip Cryptogram Validation in Stand-In Authorization is mandatory for all chip card issuers.

Issuers should consider participating in PIN Validation services for successful Stand-In Authorization of chip transactions with online PIN.

## M/Chip Advance

Mastercard® M/Chip™ Advance is a dual interface chip card specification for credit, debit, prepaid, and Mastercard® contactless programs.

M/Chip Advance:

- Integrates contactless products: Fully integrates contact and contactless cards and simplifies the adoption and implementation of contactless products.
- Provides enhanced on-card risk management: Increases the volume of approved transactions with more informed card risk management decision making.
- Supports new third-party transit, loyalty, voucher programs, and ticketing (for example, music concerts, cinema, theatre, or sports events): Provides the functionality to extend card payment services into new markets.
- Provides enhanced payment features. M/Chip 2 and M/Chip 4 have a single set of counters to manage the risk of all offline transactions. This means that the risk management functionality of the application is not able to differentiate between CVM and no-CVM transactions or contact and contactless transactions.
- Provides backwards compatibility with existing M/Chip platforms: Facilitates the migration from M/Chip 2 and M/Chip 4 to M/Chip Advance.

The M/Chip Advance card application specification is available to card developers under a specific Mastercard development agreement.

With M/Chip Advance, DE 55 (Integrated Circuit Card [ICC] System-Related Data), subelement 9F10 (Issuer Application Data [IAD]) contains expanded counters. These expanded counters are used in the ARQC when the value of the right-most bit of the CVN is 1. The IAD can be configured to include accumulators, counters, or both, in plain text or encrypted. The value of an accumulator or counter included in the IAD may be either its absolute value (for example, Accumulator Amount or Counter Number) or the value of their balance. If so, the IAD is extended with one or two, 8-byte fields.

M/Chip issuers may optionally choose to support M/Chip Advance but are not required to migrate to M/Chip Advance specifications to continue using these services.

Issuers that participate in the M/Chip Cryptogram Pre-validation service, the M/Chip Cryptogram Validation in Stand-In Authorization service, or the Combined Service Option may optionally support M/Chip Advance.

## MIP Transaction Blocking

MIP Transaction Blocking provides issuers with easy-to-manage, flexible controls that supplement their authorization strategy. MIP Transaction Blocking extends an issuer's authorization capabilities, augmenting their defenses to protect portfolios from fraud attacks, as well as manage specialized payment programs with ease. An issuer's participation in the MIP Transaction Blocking Service is optional.

Issuers may want to apply MIP Transaction Blocking to:

- Prevent the authorization of fraudulent transactions for compromised account ranges
- Prevent the authorization of transactions due to operational emergencies (for example, the issuer encounters problems supporting certain processing codes or POS PAN entry modes)
- Decline authorizations for an account range in combination with the point-of-interaction (POI) country in the event of local issues that necessitate preventing transactions from being authorized until those issues are resolved
- Protect assigned BIN ranges before they go into production or account ranges in production that are not actively used

MIP Transaction Blocking provides issuers the ability to decline authorizations in the Dual Message Authorization System based upon the issuing ICA number or account range, and one or more of the following transaction parameters:

- DE 3 (Processing Code), subfield 1 (Cardholder Transaction Type Code)
- DE 18 (Merchant Type)
- DE 22 (Point-of-Service [POS] Entry Mode), subfield 1 (POS Terminal PAN Entry Mode)
- DE 32 (Acquiring Institution ID Code)
- DE 61 (Point-of-Service [POS] Data), subfield 10 (Card Activated Terminal Level [CAT])
- DE 61 (Point-of-Service [POS] Data), subfield 13 (POS Country Code)

MIP Transaction Blocking can also provide Full BIN Blocking on authorization requests for an entire BIN range or a segment of a BIN range, defined up to 11 digits, and is available globally on both the Dual Message Authorization and Single Message Systems.

### MIP transaction block setup

The following information is required for each transaction block setup:

- ICA or Routing & Transit Number and account range
- The data elements identifying the type of transaction to be blocked
- Effective date
- The response code that will be returned in the Authorization Request Response/0110 message to the acquirer when the transaction matches the blocking criteria. Issuers may choose a response code from the following list:
  - 03 (Invalid merchant)
  - 04 (Capture card)
  - 05 (Do not honor)
  - 12 (Invalid transaction)
  - 57 (Transaction not permitted to issuer/cardholder)
  - 58 (Transaction not permitted to acquirer/terminal)

**NOTE: If issuers do not specify a decline response code, the default response code is 05 (Do not honor).**

- Registration for the optional MIP Transaction Blocking ICA Level Block Summary (SI738010-AA) and delivery endpoint.

MIP Transaction Blocking ICA Level Block Summary (SI738010-AA)

The MIP Transaction Blocking ICA Level Block Summary (SI738010-AA) is an optional report showing each ICA level block for the issuer and the account ranges associated to that block. The ICA Blocking Summary report will assist issuers in determining the account ranges that are blocked via ICA level MIP Transaction Blocking records.

For more information, refer to [Reports and files](#).

To participate

Issuers may choose to participate in and customize their MIP Transaction Blocking settings by completing the *MIP Transaction Blocking Service Request Form* (Form 810) and submitting the form to Global Customer Service.

For questions about participating in MIP Transaction Blocking, contact Global Customer Service.

Dual Message Authorization System Edits

The Dual Message Authorization System performs the following edits on Authorization Request/0100: MIP Transaction Blocking transactions.

## Full BIN Block

The Full BIN Block service blocks authorization requests for an entire BIN range or a segment of a BIN range, defined up to 11 digits.

Through this service, issuers can protect assigned BIN ranges before they go into production. Issuers also can protect account ranges in production that are not actively used. The Full BIN Block service will decline any authorization request in the identified account range with response code 14 (Invalid card number).

The Full BIN Block service is available globally on both the Dual Message Authorization and Single Message Systems. This service is recommended when a BIN has been assigned by Mastercard for use by the issuer, but that is not yet supported by the issuer's authorization system.

Participation in the Full BIN Block service is optional.

### Benefits

Issuers may want to apply authorization blocking for inactive BINs to:

- Block an entire BIN range or a segment of a BIN range.
- Combat fraud attacks on inactive BIN ranges, defined as "live" on Mastercard systems but not in production on the issuer host system.

### To Participate

To sign up for the Full BIN Block service, issuers must complete the *MIP Transaction Blocking Service Request Form* (Form 810).

## Dual Message Authorization System Edits

The Dual Message Authorization System performs the following edits on Authorization Request/0100—Full BIN Block transactions.

### Associated edits

## Name Validation Service

The Name Validation Service validates that the name provided by a registered user matches the name associated to the card at the issuer. Customers can validate cardholder name information by including a name validation request in an Account Status Inquiry (ASI) message.

## Participation requirements

Acquirers should be aware that name validation can be included in an ASI message.

Issuers will receive ASI service messages with a request for cardholder name validation. Issuers must validate the name information provided in the request message and respond with a result indicating the likelihood of a match.

The availability and effectiveness of name validation may vary, based on the issuer's capability to perform the validation.

## Name Validation Process

1. The acquirer creates an ASI Authorization Request/0100 message, when submitting name validation requests, the message will contain:
  - a. Data Element (DE) 108 (Additional Transaction Reference Data), subelement 02 (Sender Data), subfield 01 (Sender First name), subfield 02 (Sender Middle Name), and subfield 03 (Sender Last Name), DE 108 subelement 07 (Data Verification Type), subfield 01 (Data Verification Type) = 11 (Sender Data Verification Request)
  - b. DE 108, subelement 01 (Receiver/Recipient Data), subfield 01 (Receiver/Recipient First name), subfield 02 (Receiver/Recipient Middle Name), and subfield 03 (Receiver/Recipient Last Name), DE 108, subelement 07, subfield 01 = 10 (Receiver/Recipient Data Verification Request)
2. The issuer (or issuer processor) compares the name information provided in DE 108 to the cardholder name(s) on file
3. The issuer generates an ASI Authorization Response/0110 message with the name validation response included:
  - a. When sender name validation was requested, DE 108, subelement 08, subfield 02 (Sender Service Response) is populated with one of the following validation result values: A (match), B (partial match), C (no match), or U (unverified)
  - b. When receiver name validation was requested, DE 108, subelement 08 (Data Verification Response), subfield 01 (Receiver/Recipient Service Response) is populated with one of the following validation result values: A (match), B (partial match), C (no match), or U (unverified)

### For more information

For more information on the Name Validation Service, refer to *Name Validation Service Issuer Name Matching Guide*.

## Payment Cancellation Service

Payment Cancellation Service enables issuers to block unwanted card-not-present payment transactions identified in pre-authorization messages and completion records.

The cancellation of a payment will result in Mastercard declining future payment transactions for a specific account, if specified, from a particular merchant when requested by the cardholder.

Mastercard uses the issuer's payment blocking criteria to decline online authorization requests for card-not-present and recurring payments when appropriate. Also, the Global Clearing Management System (GCMS) will use the same issuer payment blocking criteria to reject the clearing records.

For more information, refer to the *Payment Cancellation Program Guide*.

Acquirers receive Authorization Request Response/0110 messages containing DE 48 (Additional Data: Private Use), subelement 84 (Merchant Advice Code) with value 21 (Payment Cancellation [Mastercard use only]) indicating Payment Cancellation.

**NOTE: The Dual Message Authorization System, not the issuer, sends the Authorization Request Response/0110 message containing DE 48, subelement 84, value 21.**

Issuers receive a store-and-forward Authorization Advice/0120 message indicating that the authorization request was blocked by the Dual Message Authorization System.

### Authorization reports

The following reports provide information that support Payment Cancellation:

- The Authorization Parameter Summary Report (SI737010-AA) includes a Payment Cancellation participant parameter in the Global Parameters section.
- The Daily Account File Activity Report (AM700010-AA) includes a section to report the Payment Cancellation account maintenance activity. This section groups Payment Cancellation activity by rejected, accepted, and purged.
- The Delete Preview Report (AM710010-AA) includes a section to report the Payment Cancellation accounts that are due to be deleted in the next 3 weeks. A total field by ICA of Payment Cancellation accounts will also display.

For a sample of the Authorization Parameter Summary Report (SI737010-AA), refer to [Reports and files](#). For a sample of the Daily Account File Activity Report (AM700010-AA) and Delete Preview Report (AM710010-AA), refer to the *Account Management System User Manual*.

### To participate

To request participation in the Payment Cancellation Service, contact Global Customer Service.

## Portfolio sales support

Mastercard offers support for customers when they buy or sell a portfolio.

### Portfolio sales support

| Service                                                                                                                                                                               | Service Available for |                      |

|                                                                                                                                                                                       | Full BIN Transfer     | Partial BIN Transfer |
| Transfer of BINs from one customer to another. After Mastercard transfers the BIN, the Dual Message Authorization System processes all transactions within the BIN under the new ICA. | √                     | √                    |
| Transfer of AMS account listings from one customer to another. After Mastercard transfers the listings, the new ICA maintains the listings.                                           | √                     |                      |

## Full BIN transfer

To transfer an entire BIN from one ICA number to another, contact the Global Customer Service team and request support for a portfolio transfer.

You will need to provide the following information:

- Old ICA number
- New ICA number
- Time and date on which the transfer will be effective
- BIN that you are buying or selling

### Automatic AMS transfer

If you are requesting an automatic AMS transfer as part of the BIN transfer, complete section "e" of the Member Conversion Questionnaire. The Global Customer Service team will provide the questionnaire.

For examples of the automatic transfer of AMS accounts and for billing information for that service, refer to the *Account Management System User Manual*.

The following table shows the transfer of BINs and AMS accounts.

### Automatic AMS transfer

| When it Occurs                                                              | Description                                                                                           |
|-----------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------|
| Before the planned transfer date                                            | The customer (new ICA number or old ICA number) requests support for a portfolio transfer.            |
| At the time and date when the transfer is effective                         | The Dual Message Authorization System moves authorization processing from the old ICA to the new ICA. |
| On the transfer effective date, after the authorization processing transfer | Mastercard automatically transfers the ownership of the AMS accounts from the old ICA to the new ICA. |
| On the evening of the transfer effective date                               | The Daily Account File Activity Report for the new ICA shows the account listings under the new ICA.  |

### Partial BIN transfer

To transfer a part of a BIN from one customer to another, notify the Global Customer Service team in writing.

You will need to provide the following information:

- Old ICA number
- New ICA number
- Time and date on which the transfer will be effective
- Which portion of the BIN requires the new routing

#### Transfer process for a partial BIN

### Transfer process for a partial BIN

The following table shows the transfer process for a partial transfer of a BIN.

| When it Occurs                   | Description                                                          |
|----------------------------------|----------------------------------------------------------------------|
| Before the planned transfer date | The customer (new ICA or old ICA) requests support for the transfer. |

| When it Occurs                                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| At the time and date when the transfer is effective | <ul style="list-style-type: none"> <li>The Dual Message Authorization System routes authorization requests for the transferred part of the BIN to the new endpoint.</li> <li>The Stand-In parameters of the new ICA number and BIN govern processing for the transferred part of the BIN.</li> <li>Mastercard bills all issuing authorization charges to the new ICA number.</li> <li>The new ICA number can add accounts within the BIN to AMS and to the Account File.</li> </ul> |

## Private Label Transaction processing

The Mastercard Private Label Program uses the existing Mastercard Network to provide efficient authorization, clearing, and settlement services for private label card transactions, in addition to value-added products and services that issuers may use with their private label programs.

Mastercard has extensive network reach, acceptance, and standardized formats that provide issuers with a network processing solution for private label card transactions, thereby addressing the infrastructure limitations of a closed-loop processing model.

In addition to providing a superior private label transaction processing solution, the Mastercard Private Label Program provides issuers with the ability to use many of the world-class, value-added services offered by Mastercard. Issuers may optionally benefit from the array of Mastercard risk management solutions, enhanced transaction processing services, and portfolio performance management expertise to facilitate financial improvement of their portfolios.

With the Private Label Program, issuers can use the Activation and Initial Load of Private Label Prepaid Card service, which is provided exclusively for transactions originating from the approved private label card portfolios of Mastercard issuers.

For more information, refer to the *Private Label Program Guide for Acquirers* and *Private Label Program Guide for Issuers*.

### Authorization Processing

Based on the issuer's private label prepaid card program, the private label prepaid cards can be magnetic stripe or chip and may or may not require the entry of a PIN.

Stages for prepaid card activation at the POS terminal:

1. The cardholder purchases a private label prepaid card and requests to have it activated at the POS terminal.
2. The merchant enters a request to activate a private label prepaid card from the POS terminal.

3. The POS terminal sends an Authorization Request/0100 message to the acquirer.
4. The acquirer forwards the Authorization Request/0100 message through the Mastercard Network to the issuer for a private label prepaid card activation request.
5. The issuer validates the request and sends an approval in an Authorization Request Response/0110 message through the Mastercard Network to the acquirer. Mastercard suggests that private label issuers approve card activation transactions using response code 00 (Approved or completed successfully).
6. The acquirer delivers the response to the POS terminal.
7. The issuer activates the private label prepaid card on its system.

Acquirers supporting the private label prepaid card activation request message must be able to send a Reversal Request/0400 message to deactivate the card if they are not able to deliver the Authorization Request Response/0110 message to the merchant's terminal or time-out waiting for a response from the Dual Message Authorization System.

Private label issuers may want to define policies and rules with their merchants for governing exceptions that may occur during the activation process, such as what actions to take if there is a decline response.

### Alternate Processing

Private label prepaid card activation plus initial load transactions are not eligible for alternate (Stand-In or alternate issuer host routing) or X-Code Processing. If the primary issuer is not available to respond to a card activation request, an Authorization Request Response/0110 message is returned to the acquirer with DE 39 (Response Code), value 91 (Authorization System or issuer system inoperative).

## Activation and Initial Load of Private Label Prepaid Cards

The Dual Message Authorization System supports card activation or deactivation requests between acquirers and private label issuers in the Europe region.

**NOTE: Applies only to the Europe region for private label card programs.**

### Benefits

The benefits of providing private label issuers with the ability to allow their cardholders to activate and to set the amount to load on their private label prepaid cards at the moment of purchase and activation at the POS terminal are as follows:

- Allows merchants to:
  - Activate prepaid cards over the Dual Message Authorization System as cards are being sold
  - Provide refunds to consumers with a private label prepaid card (typically a gift card) loaded with the full amount of the refund, rather than giving cash that could be spent at another merchant location.

- Allows issuers to keep prepaid accounts inactive until an activation request is received from the merchant and to help reduce fraud by enabling the activation of prepaid cards with or without a predefined amount.
- Provides a security measure to ensure that prepaid cards cannot be used before activation.

### **Transaction Type Identifier C09**

The Dual Message Authorization System supports Transaction Type Identifier value C09 (Card Activation) to specify private label prepaid card activation and initial load requests.

### **Authorization Processing**

For private label prepaid cards, the Dual Message Authorization System processes one transaction for both activating and initially loading a card. The activation request uses an Authorization Request/0100 message with a Payment Type processing code and a valid amount in DE 4 (Amount, Transaction) for private label prepaid card activation authorization messages. The activation also can be canceled by a Reversal Request/0400 message.

Based on the issuer's private label prepaid card program, the private label prepaid cards can be magnetic stripe or chip and may or may not require the entry of a PIN.

Stages for prepaid card activation at the POS terminal:

1. The cardholder purchases a private label prepaid card and requests to have it activated at the POS terminal.
2. The merchant enters a request to activate a private label prepaid card from the POS terminal.
3. The POS terminal sends an Authorization Request/0100 message to the acquirer.
4. The acquirer forwards the Authorization Request/0100 message via the Mastercard Network to the issuer for a private label prepaid card activation request.
5. The issuer validates the request and sends an approval in an Authorization Request Response/0110 message via the Mastercard Network to the acquirer. Mastercard suggests private label issuers approve card activation transactions using response code 00 (Approved or completed successfully).
6. The acquirer delivers the response to the POS terminal.
7. The issuer activates the private label prepaid card on its system.

Acquirers supporting the private label prepaid card activation request message must be able to send a Reversal Request/0400 message to deactivate the card if they are not able to deliver the Authorization Request Response/0110 message to the merchant's terminal or time-out waiting for a response from the Dual Message Authorization System.

Private label issuers may want to define policies and rules with their merchants for governing exceptions that may occur during the activation process, such as what actions to take if there is a decline response.

### **Alternate Processing**

Private label prepaid card activation plus initial load transactions are not eligible for alternate (Stand-In or alternate issuer host routing) or X-Code Processing. If the primary issuer is not

available to respond to a card activation request, an Authorization Request Response/0110 message is returned to the acquirer with DE 39 (Response Code), value 91 (Authorization System or issuer system inoperative).

## Private Label Non-Financial Service

The Private Label Non-Financial Service uses the capabilities with the Mastercard Private Label Program and Dual Message Authorization System to offer a non-financial service.

The Private Label Non-Financial Service provides purchase point-of-sale (POS) information to manufacturers of luxury goods for use in various applications, such as warranty registration or inventory forecasting.

For more information, refer to the *Private Label Program Guide for Acquirers* and *Private Label Program Guide for Issuers*.

### Authorization processing

The Authorization Request/0100 message that is triggered by this event includes all mandatory data elements needed to carry the product information. The Authorization Request/0100 message, capturing the purchase POS information, is initiated for purchased goods of participating merchants regardless of what form of payment was used to purchase the goods.

Product code PVA (Private Label A) is used for identification of POS information from luxury goods transactions. Product code PVA is set up in account ranges for authorization processing only. Any clearing messages received with product code PVA is rejected.

### Alternate processing

The Authorization Request/0100 message containing value PVA in DE 63 (Network Data), subfield 1 (Financial Network Code) is routed to and declined by Stand-In Authorization with a response code of 05 (Do Not Honor) in DE 39 (Response Code). X-Code also responds with value 05 if authorization cannot be obtained from Stand-In Authorization.

### For more information

For more information about the Mastercard Private Label Non-Financial Service, contact the Global Customer Service team.

## QR code payments

The quick response (QR) code payment is a fast, convenient payment option for consumers. These transactions may originate when either a consumer mobile wallet generates a QR code that can be scanned by a merchant to receive payments or a merchant generates QR code that can be scanned by a consumer's mobile device to complete payments.

For more information, refer to the [Mastercard QR: Send Program Guide](#).

## Consumer Presented QR transactions

Consumer Presented QR transactions originate when a consumer mobile wallet generates a quick response (QR) code that can be scanned by a merchant to receive payments.

Mastercard identifies:

- Mastercard Consumer Presented QR transactions when value 03 (PAN auto-entry via barcode reader) in DE 22 (Point-of-Service [POS] Entry Mode), subfield 1 (POS Terminal PAN Entry Mode)
- Mastercard Consumer Presented QR terminal capabilities through subfield 02 (Additional Terminal Capability Indicator) in DE 48 (Additional Data: Private Use), subelement 21 (Acceptance Data)

These enhancements will help ensure that tokenized Mastercard Consumer Presented QR transactions are properly identified and securely processed on the Mastercard Network.

### To participate

To submit or process tokenized Mastercard Consumer Presented QR transactions, acquirers and issuers must contact their Customer Implementation Specialist or account representatives.

## Merchant Presented QR transactions

Mastercard® Merchant Presented QR™ transactions are consumer-initiated, push payment transactions with a mobile payment device through a low-cost, point-of-interaction device.

Using a mobile payment device, the consumer makes a cashless payment by scanning a QR code at any location that accepts Mastercard Merchant Presented QR transactions.

This program extends payment services to merchants currently excluded from electronic payments and is similar to a cash experience with funds immediately available to the merchant. Merchant Presented QR provides a viable, cost-effective alternative to merchants who are cash focused, but would like an electronic option.

Merchant Presented QR operates in an alternate four-party business model that enables funds to be transferred from a licensed Mastercard customer acting as an Originating Institution (OI), to a licensed Mastercard customer acting as a Receiving Institution (RI). The transaction originates at the OI, consumer bank or third-party wallet providers and routes to the merchant after successfully authenticating and authorizing the debit from the consumer's account. The RI will credit the merchant account upon authorization and notify the merchant that the payment has been successfully received.

The QR code-based program is a payment transaction, the transfer of funds from a Mastercard Account or Maestro Account to a Mastercard Receiving Account using the Mastercard Network payment transaction, defined on the Dual Message Authorization System by using:

- DE 3 (Processing Code), subfield 1 (Cardholder Transaction Type Code) value 28 (Payment Transaction)
- A unique payment transaction type identifier DE 48 (Additional Data: Private Use), Transaction Category Code (TCC)=P (Payment Transaction), subelement 77 (Funding Transaction or Payment Transaction Type Identifier), value of C67 (Merchant Presented QR) to support the payment to the merchant.

**NOTE: The QR code will include the actual merchant MCC. The MCC is a mandatory field on the QR code. The OI must obtain the MCC from the merchant's QR code and include in the ISO message or the API.**

If Merchant Presented QR Transactions are enabled through a third-party wallet provider, the financial institution supporting the wallet provider will secure funds from a consumer account by initiating a funding transaction before processing the payment transaction.

For more information, refer to the [Mastercard QR: Send Program Guide](#).

### To participate

To submit or process Mastercard Merchant Presented QR transactions, OIs and RIs must complete and submit the *Registration for Mastercard Merchant Presented QR: Global* (Form 1274) to their regional account representative.

## Sweden Domestic Authorization Switching Service

The Dual Message Authorization System supports the authorization processing for customers that participate in Sweden Domestic Authorization Switching Service (SASS).

**NOTE: Applies only to the Europe region.**

The Dual Message Authorization System supports the following authorization processing for customers that participate in SASS:

- ATM Additional Data
- Forgotten Card at ATM
- Receipt Free Text
- Refund Transactions

### Forgotten Card at ATM

Forgotten card at ATM service invokes when a cardholder leaves the terminal without taking his or her card or when the cardholder cannot retrieve the card from the terminal for a technical

reason. This service is available only to customers that participate in Swedish Domestic Authorization Switching Service (SASS).

Reversal Request/0400: Forgotten Card

Following is a list of the data elements and values applicable to this message type. All mandatory Reversal Request/0400 data elements apply.

Applicable data elements

| Data Element                                                             | Org | Sys | Dst | Values/Comments                                                                          |
|--------------------------------------------------------------------------|-----|-----|-----|------------------------------------------------------------------------------------------|
| DE 3 (Processing Code), subfield 1 (Cardholder Transaction Type Code)    | M   | •   | M   | Contains one of the following values:<br><br>01 = Withdrawal<br><br>30 = Balance Inquiry |
| DE 4 (Amount, Transaction)                                               | M   | •   | M   | Contains value zero                                                                      |
| DE 48 (Additional Data—Private Use), subelement 58 (ATM Additional Data) | O   | X   | C   | Subfield data may be present for Swedish ATMs                                            |

**NOTE: If the issuer does not support DE 48, subelement 58, the Dual Message Authorization System will send the acquirer a Reversal Request Response/0410 message containing DE 39 (Response Code), value 57 (Transaction not permitted to issuer/cardholder).**

Third-Party Processor identification

The Third-Party Processor (TPP) Identification service assists issuers in identifying an acquirer’s third-party processor. This optional service provides issuers additional information in their fraud analysis during an account data compromise event.

Issuers that choose to register for this service will receive additional information to identify the entity involved in acquiring the transaction and presenting the transaction to the acquiring MIP.

How it works

The Dual Message Authorization System requires acquirers to submit DE 32 (Acquiring Institution ID Code) in all Authorization Request/0100 transactions. DE 32 contains the ICA number for the institution acting as the acquiring bank or merchant bank for the transaction. If an institution is acting as a processor for the acquiring bank, DE 32 should represent the acquiring bank and DE 33 (Forwarding Institution ID Code) should contain the ICA number for the forwarding or processing institution.

In addition to the values in DE 32 and DE 33 provided by the acquirer or processor in Authorization Request/0100 and Authorization Advice/0120 messages, the Dual Message Authorization System includes the additional entity identifier submitting the message in DE 48 (Additional Data: Private Use), subelement 16 (Processor Pseudo ICA). DE 48, subelement 16 contains a unique identifier from the Mastercard Registration Program (MRP) database for the TPP processing the Authorization Request/0100 or Authorization Advice/0120 message.

This data is sent in the Authorization Request/0100 and Authorization Advice/0120 messages only for participating account ranges.

### **Authorization reports**

The Authorization Parameter Summary Report (SI737010-AA) includes a TPP participant parameter in the Global Parameters section to indicate issuers that have registered to receive unique identifiers for TPPs. For a sample of the Authorization Parameter Summary Report (SI737010-AA), refer to [Reports and files](#).

### **To participate**

Issuers must register for this optional service. To request participation, contact Global Customer Service.

## Appendix C Data reference tables

*This section provides details on character and extended character sets.*

---

|                                                             |      |
|-------------------------------------------------------------|------|
| Extended character sets.....                                | 1815 |
| Swedish Domestic Authorization Switching character set..... | 1822 |

## Character sets

Character sets define how letters, numbers, symbols, and special characters are displayed in computer text.

### Which character sets does Mastercard support?

Mastercard supports ASCII (ISO 8859-1) and EBCDIC (Code Page 1047) code pages for both standard and extended character sets.

Mastercard supports standard EBCDIC formatted messages and bulk files. In addition to standard EBCDIC, Mastercard supports the extended EBCDIC format as well as the standard and extended ASCII format for both authorization messages and selected bulk files. Customers using the MIP to transmit bulk files still need to adhere to the existing Mastercard File Transfer Protocol format, that is, EBCDIC (for Header and Trailer information).

**NOTE: Extended characters: Within the full character set, the alphabet is represented as used in the English language (with no character enhancements) and characters that may be found, for example, in the Spanish alphabet where the tilde is used over the Ñ.**

Mastercard uses extended EBCDIC as the default character set type for sending messages unless otherwise specified by the customer.

Customers also have the option to send and receive either standard or extended character sets for both ASCII and EBCDIC formats in specific data elements that contain text. Following are examples of some data elements that may contain standard or extended text characters:

- DE 42 (Acceptor ID)
- DE 43 (Acceptor Name and Location)
- DE 120 (Record Data)
- DE 123 (Receipt Free Text)
- DE 124 (Member-defined Data)

The following bulk files will be supported in ASCII:

- R311: AMS File Updates
- R361: AMS File Updates (TEST)

Customers that want to receive messages in standard EBCDIC or extended or standard ASCII must inform Mastercard.

## Character sets

The following tables contain valid ASCII to EBCDIC character sets.

**NOTE: For ISO 8583, the <space> character is treated as a special character (attribute "s"). It may, however, also be used in fields designated as alphanumeric (attribute "an") but only in the form of trailing spaces used to pad out significant data to fill a fixed-length field.**

**ASCII to EBCDIC character set: ASCII hex order**

| Decimal value | ASCII hex | EBCDIC hex | ASCII symbol | Meaning                        | EBCDIC symbol | Meaning                     |
|---------------|-----------|------------|--------------|--------------------------------|---------------|-----------------------------|
| 032           | 20        | 40         | < space >    | Space                          | DS            | digit select                |
| 033           | 21        | 5A         | !            | exclamation mark               | SOS           | start of significance       |
| 034           | 22        | 7F         | "            | straight double quotation mark | FS            | field separator             |

**NOTE:** For ISO 8583, the < space > character is treated as a special character (attribute "s"). It may, however, also be used in fields designated as alphanumeric (attribute "an") but only in the form of trailing spaces used to pad out significant data to fill a fixed-length field.

## ASCII to EBCDIC character set: EBCDIC hex order

| Decimal value | EBCDIC hex | ASCII hex | EBCDIC symbol | Meaning                         | ASCII symbol | Meaning              |
|---------------|------------|-----------|---------------|---------------------------------|--------------|----------------------|

## Extended character sets

These tables contain valid ASCII to EBCDIC extended character sets.

### Extended Character Set: ASCII Hex order

| Decimal value | ASCII hex | EBCDIC hex | ASCII character representation | Meaning               | Mapped character | Mapping hex |
|---------------|-----------|------------|--------------------------------|-----------------------|------------------|-------------|
| 192           | C0        | 64         | À                              | capital A, grave      | A                | 41          |
| 193           | C1        | 65         | Á                              | capital A, acute      | A                | 41          |
| 194           | C2        | 62         | Â                              | capital A, circumflex | A                | 41          |
| 195           | C3        | 66         | Ã                              | capital A, tilde      | A                | 41          |
| 196           | C4        | 63         | Ä                              | capital A, umlaut     | A                | 41          |
| 197           | C5        | 67         | Å                              | capital A, ring       | A                | 41          |

## Swedish Domestic Authorization Switching character set

Customers using the Swedish Domestic Authorization Switching Service (SASS) also may support Swedish national characters in EBCDIC as described in the following table.

Swedish Domestic Authorization Switching character set

| EBCDIC IBM-278 | EBCDIC<br>(Hexadecimal) | ASCII<br>(Hexadecimal) | Graphic | Attribute |
|----------------|-------------------------|------------------------|---------|-----------|
| Å              | 5B                      | 24                     | \$      | s         |
| Ä              | 7B                      | 23                     | #       | s         |
| Ö              | 7C                      | 40                     | @       | s         |
| å              | D0                      | 7d                     | }       | s         |
| ä              | C0                      | 7b                     | {       | s         |

# Appendix D System access information

*This section provides details on accessing the Mastercard Dual Message Authorization System. For more information, refer to the [Secured Data Communications](#).*

---

|                       |      |
|-----------------------|------|
| Acquirer methods..... | 1824 |
| Issuer methods.....   | 1825 |

## Accessing the Dual Message Authorization System

To process authorization activity, acquirers and issuers must access the Mastercard Network. This network is the path by which they send and receive authorization messages and related data.

Selecting a particular authorization processing access method depends on several factors, including:

- Physical installations present at the point-of-interaction and at the customer site
- Volume of incoming and outgoing authorizations
- Customer location

For help in selecting an appropriate access method, contact a Customer Implementation Services specialist.

## Acquirer methods

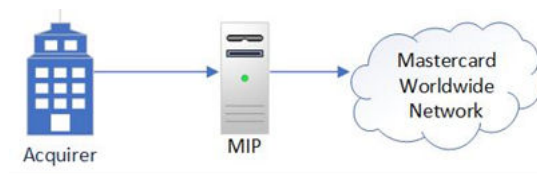

Online host-to-MIP access is available to acquirers. There are several configurations for connectivity to a MIP or MIPs for online access.

### Online host-to-MIP access

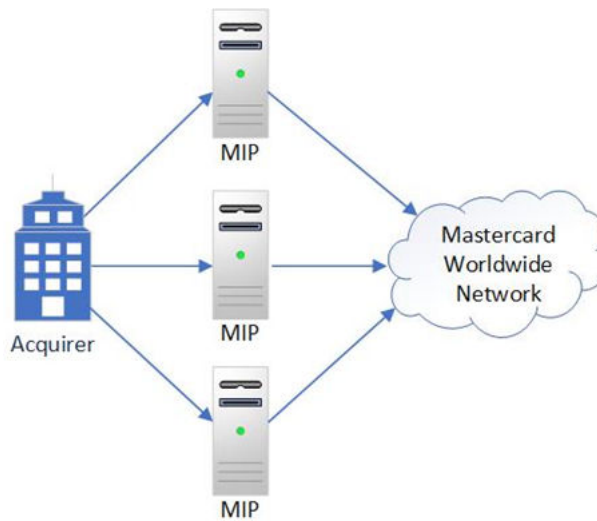

These diagrams show configurations for connectivity to a MIP or MIPS for online access.

To have direct connectivity to a MIP, the acquirer must have a host computer that can support this type of connectivity.

#### Acquirer online: direct host to MIP connectivity

### Acquirer online: direct host to multiple MIP connectivity

Mastercard offers other interfaces to acquirers that do not have online connectivity. Mastercard converts messages sent through these other interfaces into online messages.

## Issuer methods

Issuers may choose the online host-to-MIP access to the Mastercard Network.

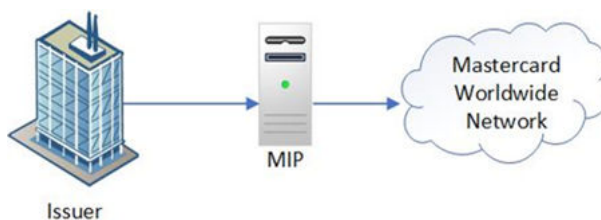

### Online host-to-MIP access

Online host-to-MIP issuers receive authorization requests from the Dual Message Authorization System via a MIP connected to the issuer's host.

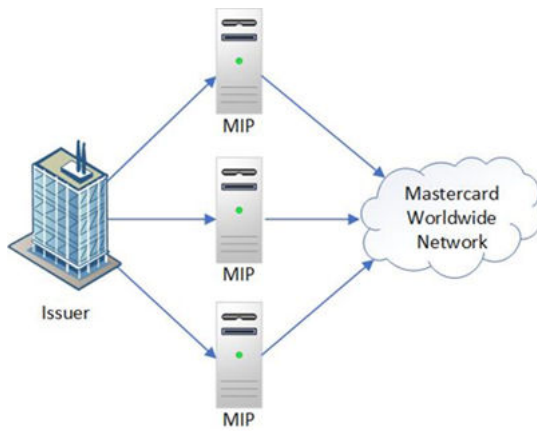

These diagrams show configurations for connectivity to a MIP or MIPs for online access.

To have direct connectivity to a MIP, the issuer must have a host computer that can support this type of connectivity.

### Issuer online: direct host to MIP connectivity

**Issuer online: direct host to multiple MIP connectivity**

## Appendix E Message timer table

This section provides information on the message routing time values.

### Dual Message Authorization System message routing timers

Following are the specific Mastercard Network message routing timer values applicable to acquirer-generated 0100, 0120, and 0400 messages. All system-generated Advice/0120, Issuer File Update/03xx, system-generated Reversal/0420, Administrative/06xx, and Network Management/08xx messages remain unchanged and retain their current timer values

**NOTE: Mastercard reserves the right to adjust local market timer values based on specific market conditions and as additional exception countries are added, they will be announced in a global announcement.**

### Dual Message Authorization System message routing timers

| Product and Transaction Type   | Issuer Response Time (in seconds) | Alternate Authorization Service Provider (if applicable) | Acquirer Minimum Wait Time (in seconds) |
|--------------------------------|-----------------------------------|----------------------------------------------------------|-----------------------------------------|
| Mastercard Credit: POS         | 9                                 | 3                                                        | 12                                      |
| Mastercard: POS PIN for Credit | 18                                | 6                                                        | 24                                      |
| Mastercard: ATM                | 12                                | 6                                                        | 18                                      |
| Debit Mastercard: POS          | Same as Mastercard Credit: POS    | Same as Mastercard Credit: POS                           | Same as Mastercard Credit: POS          |
| Maestro: All                   | 18                                | 6                                                        | 24                                      |
| Cirrus: ATM                    | 18                                | 6                                                        | 24                                      |
| Private Label: POS             | 12                                | 6                                                        | 18                                      |
| AMEX: POS                      | 12                                | 6                                                        | 18                                      |
| Visa: POS                      | 12                                | 6                                                        | 18                                      |

For transactions acquired in the countries of Brazil, Canada, the United Kingdom, and the United States, Mastercard has reduced the timers by 2 additional seconds. In these countries, the maximum time Mastercard will wait before invoking alternate authorization provider processing is reduced to 7 seconds and the minimum time that an acquirer must wait is reduced to 10 seconds.

For Maestro POS transactions acquired in the Netherlands, Mastercard has reduced the timer to 7 seconds, which is the maximum time Mastercard will wait before invoking alternate authorization provider processing. If no response is received within 10 seconds, Mastercard will send a time-out response to the acquirer.

Because the Mastercard Network does not track session status information for an acquirer, sign-on/sign-off for acquirers is not required. However, acquirers optionally may send Mastercard Network sign-on/sign-off messages (for example, if required by vendor software).

A transaction is considered to be PIN for Credit if it is Dual Message Authorization System acquired, but the issuer keys are managed by the Single Message System. If the issuer is Dual Message Authorization System managed, the transaction is not flagged as being PIN for Credit and defaults to the standard POS timer of 9 seconds.

### Routing timer values for POS transactions in Switzerland

Acquirers that support transactions submitted by merchants in Switzerland and issuers globally must take into account POS routing timer response times to provide authorization response messages in a timely manner and to avoid timeouts at the network level.

Routing response times in Switzerland that apply to acquirer-generated Authorization Request/0100, Authorization Advice/0120, and Reversal Request/0400 messages are listed in table format. All Network Management/08xx, Issuer File Update/03xx, Administrative/06xx, and system-generated Authorization Advice messages remain unchanged and retain their current timer attributes.

#### Routing timers for Switzerland

| Product and transaction type | Issuer response time (in seconds) | Alternate authorization service provider, if applicable (in seconds) | Acquirer minimum wait time (in seconds) |
|------------------------------|-----------------------------------|----------------------------------------------------------------------|-----------------------------------------|
| Mastercard Credit: POS       | 6                                 | 3                                                                    | 9                                       |
| Debit Mastercard: POS        | 6                                 | 3                                                                    | 9                                       |
| Maestro: POS                 | 6                                 | 3                                                                    | 9                                       |

# Appendix F Transaction research information

*A transaction research request is a request by a customer for Mastercard to provide information about a transaction.*

---

|                                                   |      |
|---------------------------------------------------|------|
| About the Transaction Research Request Tool.....  | 1830 |
| Request the Transaction Research Tool.....        | 1830 |

Customers can use either of the following two methods to research information about previous transactions:

- Transaction Investigator tool to conduct research about specific transactions or a range of transactions for an account number. The report generated provides customers with transactional data such as card number, card validation code 2 (CVC 2) response, point-of-sale entry mode, cardholder present information, merchant advice code, and message type identifier (MTI).
- If the transaction is over 180 days, customers can submit a request using the *Authorization Research Request* (Form 074). The Global Customer Service team will perform the research for you. The team provides information about authorization transactions, duplicate reports, microfiche re-creation, currency conversion rates, BIN and ICA numbers, and conversions.

## About the Transaction Research Request Tool

Customers can use the *Authorization Research Request* (Form 0074) to request the Global Customer Service team to perform research for you.

If you submit a transaction research request by completing and sending the *Authorization Research Request* (Form 0704) to Mastercard, Mastercard sends you a letter, with the authorization information, that you can use for chargeback purposes. If you request the services informally via a customer representative, you will not receive a letter.

## Request the Transaction Research Tool

Complete the following steps to request the Transaction Research Tool.

### Procedure

1. Log on to Mastercard Connect®.
2. Enter your **User ID** and **Password**.
3. Click **Store** on the main menu (located in the upper right corner) on the Mastercard Connect® home page.
4. Scroll to or search for **Transaction Research**.
5. Click **Add to Cart**.  
A confirmation message appears.
6. Click **Cart** to display the cart, and then click **Check Out** to display the Order Details window.

7. Under **Order Details**, click **Review Order** > **Place Order**.

Once the Security Administrator approves the request, Transaction Research will appear under the Applications menu on the Mastercard Connect® home page.

## How to Access the Transaction Research Tool

Complete the following steps to access the Transaction Research Tool.

1. Log on to Mastercard Connect®.
2. On the **Applications** menu, click **Transaction Research**. The Mastercard Authorization Transaction Research page appears.

## Submit an Authorization request

Complete the following steps to submit a request through the Transaction Research Tool.

### Procedure

1. In the **Card Number** box, enter the cardholder account number that you want to research.

**NOTE: Mastercard uses the optional ICA number for your tracking purposes only. If you enter an ICA number, it appears on your billing report to help you identify transactions.**

2. In the **Date Range** area, enter a starting transaction date and an ending transaction date using a MM/DD/YYYY format or click the **Calendar** link to select a date.
3. To identify a transaction more specifically by its approval code, enter the **Authorization Code**.
4. To identify a transaction more specifically by its amount, select one of the following options:
  - Click **All Transactions** to retrieve all transactions.
  - Click **Single Transaction**, and then enter the amount in U.S. dollars to identify a single transaction.
  - Click **Transaction Range**, and then enter a starting transaction amount in U.S. dollars and the ending transaction amount in U.S. dollars to identify a range of transactions.
5. To view recurring payments only, select the **View Only Recurring Payments** check box.

6. Click **Search**. The search results page displays.
7. To display the detailed results for a specific transaction, select the transaction you want, and then click **Detail**.

## Results

The Authorization Transaction Research tool displays a presence indicator for the following data elements in which they are present: DE 35 (Track 2 Data), DE 45 (Track 1 Data), and CVC 2 values in DE 48 (Additional Data: Private Use), subelement 92 (CVC 2).

## About fees for transaction research requests

A general research fee applies to each customer inquiry requesting information that is readily available to the customer in a Mastercard publication, report, service, or other source.

Refer to the **Pricing and Billing Resource Center** application on Mastercard Connect® for fees and billing information.

## Product Value Constraints

Product value constraints list types of transactions permitted by card program, and the interrelated value constraints for certain data elements carried in the Dual Message Authorization System messages.

The business rules related to the card programs Mastercard supports differentiate between the nature of the transactions permitted for:

- Mastercard (MCC)
- Debit Mastercard (DMC)
- Maestro (MSI)
- Cirrus (CIR)
- Private Label (PVL)

## Permitted Transactions by card program

Following are the types of transactions permitted by card program and the interrelated value constraints for certain data elements in Dual Message Authorization System messages.

The interrelated data elements are:

- DE 3 (Processing Code)
- DE 22 (Point-of-Service [POS] Entry Mode)
- DE 52 (Personal ID Number [PIN] Data)
- DE 61 (Point-of-Service [POS] Data)

### Permitted Transactions by Card Program

Use the reference number in the Ref column in the following tables with the specific value constraints in the corresponding [Value Constraints by Transaction Type](#) table.

#### ATM Withdrawal

| Ref | Transaction Type | PAN Entry Mode  | CVM        | MCC | DMC | MSI | CIR | PVL | Comments                                                                                                                                                                                                                                  |

## Appendix G Transaction data classifications table

This section provides details on the transaction data classifications table.

Category One: Transaction data that, when received by a customer or Service Provider, must only be used, or disclosed by the customer or Service Provider for the purpose of carrying out the customer's issuing program, acquiring program, or digital activities (for example, as relating to digital wallets and tokenization).

Category Two: Transaction data that, when received by a customer or Service Provider, must only be used, or disclosed in connection with the specific purpose for which it was provided (for example, as relating to participation in a program or service).

### Transaction data classifications

| Data element | Data element description                         | Transaction data category |
|--------------|--------------------------------------------------|---------------------------|
| DE 1         | Bit Map, Secondary                               | One                       |
| DE 2         | Primary Account Number [PAN]                     | One                       |
| DE 3         | Processing Code                                  | One                       |

## acceptor

A person or entity that agrees to accept payment cards or devices bearing a particular brand or in respect to an agreement with the issuer. Also referred to as a merchant, ATM, bank, merchant ATM, or other entity authorized to accept brand transactions.

**Plural Form:** acceptors

## acceptance brand

Acceptance brands are Mastercard and other private label brands, such as cards specific to a particular department store or airline.

**Plural Form:** acceptance brands

## acquirer

A licensed Mastercard customer that acquires the data relating to a transaction from the acceptor and submits that data for authorization. The acquirer also supports clearing and settlement functions to exchange funds between the issuer and the acceptor. Also referred to as an acquiring bank, acquirer bank, merchant bank, or acquiring financial institution.

**Plural Form:** acquirers

## acquirer host

A term referring to customer host processing at the acquirer's location.

## advice message

A message that notifies a party of an action that has been taken, requiring no response.

**Plural Form:** advice messages

## advisement

A message that identifies the net settlement position of one or more ICA numbers (or customers) and is transmitted to the destination specified by the member Net Settlement Agreement (NSA) form.

**Plural Form:** advisements

## alternate issuer host

Alternate issuer authorization route used instead of the Stand-In Authorization; available in Europe region.

## Authorization

Real-time communication between acquirers and issuers to approve or decline the use of a Mastercard-branded card, access device, or account to conduct a transaction. Approval from issuers will create a financial obligation from the issuer to the acquirer (for a transaction that debits funds from a cardholder's account) or from the acquirer to the issuer (for a transaction that credits funds to a cardholder's account).

## authorization request

A request by an acquirer for issuer approval to complete a transaction involving a payment card.

**Plural Form:** authorization requests

## back-office process

Non-client-facing tasks that keep the business running and provide support for front-end operations.

## batch processing

A type of data processing operation and data communications transmission where related transactions are grouped together and transmitted for processing, usually by the same computer and under the same application; generally regarded as non-real-time data traffic comprising large files; type of data traffic where response time is not critical.

## cardholder

A cardholder is an authorized person to whom a payment card or a device payment has been issued. Also referred to as a consumer or account holder.

**Plural Form:** cardholders

## Clearing

Multiple clearing batch processes per day (that is, clearing cycles) determine and calculate processing costs, resulting in one net amount per acquirer and issuer per clearing cycle.

## Dual Message Authorization System

The Mastercard Dual Message Authorization System is a global real-time message processing system and is a component of the Mastercard Network. The Mastercard Network supports real-time authorization processing followed by batch reconciliation leading to settlement of funds between acquirers and issuers.

The Authorization System processing is integrated with the acquirer and issuer processing system communicates in real time to process authorization data to get an issuer decision.

Mastercard acquirers and issuers leverage the Authorization System to exchange financial transaction data captured at the point-of-interaction device to obtain an authorization decision.

The Authorization System consists of both hardware and software components. The physical computing infrastructure includes servers, routers, switches, and cabling. This hardware is configured with Mastercard's proprietary technology, which makes it a Mastercard interface processor (MIP) and is physically set up and connected with an acquirer or issuer processing system in their data centers.

**Plural Form:** Dual Message Authorization System

## Dual Message Clearing System

The Dual Message Clearing System or Mastercard Global Clearing Management System (GCMS) is a component of the Mastercard Network that provides a central mechanism for the exchange of offline financial clearing messages. All participants are both senders and receivers of clearing data.

## echo

Data repeated back to the sender by the recipient to verify that it was received correctly

## encryption

The process by which data is translated into secret code. Encryption is the most effective way to secure data. To read an encrypted file, the user must have access to a key or password that enables them to decrypt it.

## exception processing

A procedure for managing transactions that cannot be processed or which are interrupted.

## fraud

A deception deliberately practiced to secure unlawful gain.

## fraudulent transaction

A transaction effected using a cardholder's account number which is not engaged in or authorized by the cardholder. Such transactions are categorized as lost, stolen, not received, issued on a fraudulent application, counterfeit, fraudulent processing of transactions, account takeover (ATO), or other fraudulent conditions.

**Plural Form:** fraudulent transactions

## host

An intelligent processor or device that is connected to a network and satisfies the needs of remote users.

## International Organization for Standardization (ISO)

### International Organization for Standardization 8583:1987

The international standard for bankcard-originated messages and interchange message specifications.

**Plural Form:** International Organization for Standardization (ISO) 8583:1987

**Abbreviation:** ISO 8583:1987

## issuer

An issuer is a licensed Mastercard customer that issues cards or accounts and is responsible for approving or declining authorization requests. The issuer also bills cardholders and supports clearing and settlement functions to exchange funds between the cardholders account and the acquirer. Also referred to as an issuing bank, issuer bank, cardholder bank, or issuing financial institution.

**Plural Form:** issuers

## issuer host

A term referring to customer host processing at the issuer's location.

## Mastercard Network

The computer hardware and software operated by and on behalf of the Corporation for the routing, processing, and settlement of Transactions and PTA Transactions including, without limitation, the Mastercard Network, the Mastercard ATM Network, the Dual Message System, the Single Message System, the Global Clearing Management System (GCMS), the Settlement Account Management (SAM) system, and the China Switch system.

**Plural Form:** Mastercard Network

## Mastercard interface processor (MIP)

Front-end communications processor placed on-site at a Mastercard customer's facility or at a processor or hub site. The MIP provides access to the Mastercard Network.

**Plural Form:** Mastercard interface processors

**Abbreviation:** MIP

## Network

See Switch.

## Network Enablement Partner

A service provider that has a direct agreement with Mastercard and performs certain functions on behalf of one or more customers.

**Plural Form:** Network Enablement Partners

## primary issuer

Banking primary issuer, also known as an issuing bank or card issuer, is a financial institution that provides a cardholder with a payment card

## processor

A processor provides authorization, clearing, or settlement services on behalf of a customer. Also referred to as a third-party processor or payment processor.

**Plural Form:** processors

## reason code

Also known as message reason code. For each chargeback, an issuer selects and submits a numeric reason code. This code assist the merchant and acquirer diagnose errors and improve customer experience.

**Plural Form:** reason codes

## receipt

A hard copy document recording a transaction that took place at the point of interaction, with a description that usually includes the date, merchant name/location, primary account number, amount, and reference number.

## reconciliation

Process by which settlement payments are balanced against amounts and totals as provided by the association's processing systems.

## request

A message originated an interactive series of messages.

**Plural Form:** requests

## response code

Response codes indicate the disposition of a previous message or an action taken as a result of receipt of a previous message.

**Plural Form:** response codes

## response time

The elapsed time between the generation of the last character of a message at a terminal and the receipt of the first character of the reply. It includes terminal delay and network delay.

**Plural Form:** response times

## reversal message

A message relating to a reversal.

**Plural Form:** reversal messages

## service provider

A person or entity that is registered with Mastercard by a customer to perform services related to the customers issuing or an acquiring activity.

**Plural Form:** service providers

## Settlement

Aggregates financial positions from all clearing settlement information into one overall daily net settlement amount for each acquirer and issuer. Creating and distributing advisements (notifications) to acquirers and issuers along with Transfer Funds Orders to Settlement Banks for amounts to be transferred to or collected from acquirers and issuers.

## Single Message System

A global real-time message processing system and is a component of the Mastercard Network. The Mastercard Network supports real-time authorization processing followed by batch reconciliation leading to settlement of funds between acquirers and issuers.

Mastercard acquirers and issuers leverage the Single Message System to exchange financial transaction data captured at the point-of-interaction device. The Single Message System, through a single financial message interaction, fulfills authorization processing, reconciliation, and settlement functions.

The Single Message System consists of both hardware and software components. The physical computing infrastructure includes servers, routers, switches, and cabling. This hardware is configured with Mastercard's proprietary technology, which makes it a Mastercard interface processor (MIP) and is physically set up and connected with an acquirer or issuer processing system in their data centers.

**Plural Form:** Single Message System

**Abbreviation:** Single Message System

## Stand-In Authorization

Authorization processing provided by Mastercard for online issuers that are unavailable or that cannot be reached.

## Switch

The computer hardware and software operated by and on behalf of a payment scheme for the routing, processing, and settlement of transactions bearing the payment scheme brand in accordance with such payment scheme's rules and regulations, and which may also be used to route transactions to another payment scheme's switch or to route, process, and settle non-branded (also called private label) transactions as agreed by the participating parties. Also called a Network.

**Plural Form:** Switches

## Dual Message Switch

A Switch used to process transactions for which authorization and clearing occurs separately in a dual message format. The Mastercard Dual Message System (both authorization and clearing) is a Dual Message Switch.

## Single Message Switch

A Switch used to process transactions for which authorization and clearing occurs in a single message format. The Mastercard Single Message System is a Single Message Switch.

## X-Code, X-Code Processing

A system that performs issuer functions by receiving and responding to authorization requests at the acquirer Mastercard interface processor (MIP).

| DE 127 (Private Data).....                            | 1950 |
| DE 128 (Message Authentication Code).....             | 1950 |

## DE 1 (Bit Map, Secondary)

DE 1 (Bit Map, Secondary) is a series of 64 bits that identifies the presence (1) or absence (0) of each data element in the second segment of a message. This would include DE 65 (Bit Map, Extended) through DE 128 (Message Authentication Code [MAC]).

**Plural Form:** DE 1 (Bit Map, Secondary)

**Abbreviation:** DE 1

## DE 2 (Primary Account Number [PAN])

DE 2 (Primary Account Number [PAN]) is a series of digits used to identify a customer account or relationship.

**Plural Form:** DE 2 (Primary Account Number [PAN])

**Abbreviation:** DE 2

## DE 3 (Processing Code)

DE 3 (Processing Code) describes the effect of a transaction on the customer account and the type of accounts affected.

**Plural Form:** DE 3 (Processing Code)

**Abbreviation:** DE 3

## DE 4 (Amount, Transaction)

DE 4 (Amount, Transaction) is the amount of funds the cardholder requested in the local currency of the acquirer or source location of the transaction.

**Plural Form:** DE 4 (Amount, Transaction)

**Abbreviation:** DE 4

## DE 5 (Amount, Settlement)

DE 5 (Amount, Settlement) is the amount of funds to be transferred between the acquirer and the issuer equal to DE 4 (Amount, Transaction) in the settlement currency. Mastercard programs and services use U.S. dollars as the currency of settlement.

**Plural Form:** DE 5 (Amount, Settlement)

**Abbreviation:** DE 5

## DE 6 (Amount, Cardholder Billing)

DE 6 (Amount, Cardholder Billing) indicates the transaction amount in the issuer's currency. It is the amount billed to the cardholder in the cardholder account currency, excluding cardholder billing fees.

**Plural Form:** DE 6 (Amount, Cardholder Billing)

**Abbreviation:** DE 6

## DE 7 (Transmission Date and Time)

DE 7 (Transmission Date and Time) is the date and time that a message is entered into the Mastercard Network. Date and time must be expressed in Coordinated Universal Time (UTC).

**Plural Form:** DE 7 (Transmission Date and Time)

**Abbreviation:** DE 7

## DE 8 (Amount, Cardholder Billing Fee)

DE 8 (Amount, Cardholder Billing Fee) is the fee the issuer bills to the cardholder in the same currency as DE 6 (Amount, Cardholder Billing).

**Plural Form:** DE 8 (Amount, Cardholder Billing Fee)

**Abbreviation:** DE 8

## DE 9 (Conversion Rate, Settlement)

DE 9 (Conversion Rate, Settlement) is the factor used in the conversion from transaction to settlement amount. DE 4 (Amount, Transaction) is multiplied by DE 9 to determine DE 5 (Amount, Settlement).

**Plural Form:** DE 9 (Conversion Rate, Settlement)

**Abbreviation:** DE 9

## DE 10 (Conversion Rate, Cardholder Billing)

DE 10 (Conversion Rate, Cardholder Billing) is the factor used in the conversion from transaction to cardholder billing amount. DE 4 (Amount, Transaction) is multiplied by DE 10 to determine DE 6 (Amount, Cardholder Billing).

**Plural Form:** DE 10 (Conversion Rate, Cardholder Billing)

**Abbreviation:** DE 10

## DE 11 (System Trace Audit Number [STAN])

DE 11 (Systems Trace Audit Number [STAN]) is a number a message initiator assigns to uniquely identify a transaction.

**Plural Form:** DE 11 (System Trace Audit Number [STAN])

**Abbreviation:** DE 11

## DE 12 (Time, Local Transaction)

DE 12 (Time, Local Transaction) is the local time at which the transaction takes place at the point of acceptor location.

**Plural Form:** DE 12 (Time, Local Transaction)

**Abbreviation:** DE 12

## DE 13 (Date, Local Transaction)

DE 13 (Date, Local Transaction) is the local month and day on which the transaction takes place at the point of acceptor location.

**Plural Form:** DE 13 (Date, Local Transaction)

**Abbreviation:** DE 13

## DE 14 (Date, Expiration)

DE 14 (Date, Expiration) specifies the year and month after which an issuer designates a cardholder's card to be expired.

**Plural Form:** DE 14 (Date, Expiration)

**Abbreviation:** DE 14

## DE 15 (Date, Settlement)

DE 15 (Date, Settlement) is the date (month and day) that funds will be transferred between an acquirer and an issuer or an appropriate intermediate network facility (INF).

**Plural Form:** DE 15 (Date, Settlement)

**Abbreviation:** DE 15

## DE 16 (Date, Conversion)

DE 16 (Date, Conversion) indicates the effective date of DE 9 (Conversion Rate, Settlement) and also DE 10 (Conversion Rate, Cardholder Billing) whenever these data elements are present within a message.

**Plural Form:** DE 16 (Date, Conversion)

**Abbreviation:** DE 16

## DE 17 (Date, Capture)

DE 17 (Date, Capture) is the month and day the acquirer processed the transaction data.

**Plural Form:** DE 17 (Date, Capture)

**Abbreviation:** DE 17

## DE 18 (Merchant Type)

DE 18 (Merchant Type) is the classification (acceptor business code/merchant category code [MCC]) of the merchant's type of business or service.

**Plural Form:** DE 18 (Merchant Type)

**Abbreviation:** DE 18

## DE 19 (Acquiring Institution Country Code)

DE 19 (Acquiring Institution Country Code) is based on Mastercard franchise data information.

**Plural Form:** DE 19 (Acquiring Institution Country Code)

**Abbreviation:** DE 19

## DE 20 (Primary Account Number [PAN] Country Code)

DE 20 (Primary Account Number [PAN] Country Code) is a code identifying the country where the card issuer is located.

**Plural Form:** DE 20 (Primary Account Number [PAN] Country Code)

**Abbreviation:** DE 20

## DE 21 (Forwarding Institution Country Code)

DE 21 (Forwarding Institution Country Code) is the code of the country where the forwarding institution is located.

**Plural Form:** DE 21 (Forwarding Institution Country Code)

**Abbreviation:** DE 21

## DE 22 (Point-of-Service [POS] Entry Mode)

DE 22 (Point-of-Service [POS] Entry Mode) indicates the method used for PAN entry to initiate a transaction and the PIN entry capabilities.

**Plural Form:** DE 22 (Point-of-Service [POS] Entry Mode)

**Abbreviation:** DE 22

## DE 23 (Card Sequence Number)

DE 23 (Card Sequence Number) distinguishes among separate cards having the same DE 2 (Primary Account Number [PAN]) or DE 34 (Primary Account Number [PAN] Extended). Issuers may encode chip cards with Card Sequence Numbers. Acquirers with chip-reading capability may pass this information encoded on the chip in DE 23 of Authorization Request/0100 messages.

**Plural Form:** DE 23 (Card Sequence Number)

**Abbreviation:** DE 23

## DE 24 (Network International ID)

DE 24 (Network International ID) identifies a single international network of card issuers.

**Plural Form:** DE 24 (Network International ID)

**Abbreviation:** DE 24

## DE 25 (Point-of-Service [POS] Condition Code)

DE 25 (Point-of-Service [POS] Condition Code) is an ID of the condition under which the transaction takes place at the point of interaction.

**Plural Form:** DE 25 (Point-of-Service [POS] Condition Code)

**Abbreviation:** DE 25

## DE 26 (Point-of-Service (POS) Personal ID Number [PIN] Capture Code)

DE 26 (Point-of-Service [POS] Personal ID Number [PIN] Capture Code) indicates the technique, maximum number, or both of PIN characters that can be accepted by the POS terminal used to construct the PIN data.

**Plural Form:** DE 26 (Point-of-Service (POS) Personal ID Number [PIN] Capture Code)

**Abbreviation:** DE 26

## DE 27 (Authorization ID Response Length)

DE 27 (Authorization ID Response Length) is the maximum length of the authorization response that the acquirer can accommodate. The issuer or its agent is expected to limit response to this length.

**Plural Form:** DE 27 (Authorization ID Response Length)

**Abbreviation:** DE 27

## DE 28 (Amount, Transaction Fee)

DE 28 (Amount, Transaction Fee) is the fee charged (for example, by the acquirer) for transaction activity in the currency of DE 4 (Amount, Transaction).

**Plural Form:** DE 28 (Amount, Transaction Fee)

**Abbreviation:** DE 28

## DE 29 (Amount, Settlement Fee)

DE 29 (Amount, Settlement Fee) is the fee to be transferred between the acquirer and the issuer equal to DE 28 (Amount, Transaction Fee) in the currency of DE 5 (Amount, Settlement).

**Plural Form:** DE 29 (Amount, Settlement Fee)

**Abbreviation:** DE 29

## DE 30 (Amount, Transaction Processing Fee)

DE 30 (Amount, Transaction Processing Fee) is the fee charged (for example, by the acquirer, issuer, or INF) for the handling and routing of messages in the currency of DE 4 (Amount, Transaction).

**Plural Form:** DE 30 (Amount, Transaction Processing Fee)

**Abbreviation:** DE 30

## DE 31 (Amount, Settlement Processing Fee)

DE 31 (Amount, Settlement Processing Fee) is the fee charged (for example, by the acquirer, issuer, or INF) for the handling and routing of messages in the currency of DE 5 (Amount, Settlement).

**Plural Form:** DE 31 (Amount, Settlement Processing Fee)

**Abbreviation:** DE 31

## DE 32 (Acquiring Institution ID Code)

DE 32 (Acquiring Institution ID Code) identifies the acquiring institution (for example, merchant bank) or its agent.

**Plural Form:** DE 32 (Acquiring Institution ID Code)

**Abbreviation:** DE 32

## DE 33 (Forwarding Institution ID Code)

DE 33 (Forwarding Institution ID Code) identifies the institution forwarding a Request or Advice message in an interchange system if it is not the same institution as specified in DE 32 (Acquiring Institution ID Code). DE 33 is used within a message to contain the Mastercard six-

digit customer ID number of the customer or INF responsible for directly routing that message to the Dual Message Authorization System.

**Plural Form:** DE 33 (Forwarding Institution ID Code)

**Abbreviation:** DE 33

## DE 34 (Primary Account Number [PAN], Extended)

DE 34 (Primary Account Number [PAN], Extended) identifies a customer account or relationship, and is used only when PAN begins with a 59 BIN.

**Plural Form:** DE 34 (Primary Account Number [PAN], Extended)

**Abbreviation:** DE 34

## DE 35 (Track 2 Data)

DE 35 (Track 2 Data) is the information encoded on track 2 of the card magnetic stripe as defined in the ISO 7813 specification, including data element separators but excluding beginning and ending sentinels and longitudinal redundancy check (LRC) characters as defined therein.

**Plural Form:** DE 35 (Track 2 Data)

**Abbreviation:** DE 35

## DE 36 (Track 3 Data)

DE 36 (Track 3 Data) is the information encoded on track 3 of the card magnetic stripe as defined in the ISO 4909:1986 specification, including data element separators but excluding beginning and ending sentinels and LRC characters as defined therein.

**Plural Form:** DE 36 (Track 3 Data)

**Abbreviation:** DE 36

## DE 37 (Retrieval Reference Number)

DE 37 (Retrieval Reference Number) is a document reference number supplied by the system retaining the original source document of the transaction and assists in locating that source document or a copy thereof. DE 37 is made available for use by automated merchant POS systems that may be interconnected into the interchange system. Merchant POS systems may assign a unique receipt or sales document ID to be used to satisfy regulatory or legal requirements when the merchant performs source document capture and truncation. DE 37

may be used to relay source document reference numbers to the issuer at the time each transaction is processed.

**Plural Form:** DE 37 (Retrieval Reference Number)

**Abbreviation:** DE 37

## DE 38 (Authorization ID Response)

DE 38 (Authorization ID Response) is a transaction response ID code that the authorizing institution assigns. DE 38 is used to transmit a card issuer's "authorization code" for Authorization transactions.

**Plural Form:** DE 38 (Authorization ID Response)

**Abbreviation:** DE 38

## DE 39 (Response Code)

DE 39 (Response Code) defines the disposition of a previous message or an action taken as a result of receipt of a previous message. Response codes also are used to indicate approval or decline of a transaction. In the event an authorization is declined, the response code indicates the reason for rejection and may indicate an action to be taken at the acceptor (for example, capture card).

**Plural Form:** DE 39 (Response Code)

**Abbreviation:** DE 39

## DE 40 (Service Restriction Code)

DE 40 (Service Restriction Code) identifies geographic or service availability.

**Plural Form:** DE 40 (Service Restriction Code)

**Abbreviation:**

## DE 41 (Acceptor Terminal ID)

DE 41 (Acceptor Terminal ID) is the identifier assigned by the acceptor or the acquirer to the terminal, payment gateway, or other acceptance device used to capture account data to affect a transaction at the acceptor location.

**Plural Form:** DE 41 (Acceptor Terminal ID)

**Abbreviation:** DE 41

## DE 42 (Acceptor ID)

DE 42 (Acceptor ID) contains the identifier assigned by the acquirer to the acceptor and its location, or to the payment facilitator.

**Plural Form:** DE 42 (Acceptor ID)

**Abbreviation:** DE 42

## DE 43 (Acceptor Name and Location)

DE 43 (Acceptor Name and Location) contains the name and location of the acceptor point of interaction.

**Plural Form:** DE 43 (Acceptor Name and Location)

**Abbreviation:** DE 43

## DE 44 (Additional Response Data)

DE 44 (Additional Response Data) provides other supplemental data that may be required in response to an authorization or other type of transaction request. This data element may also be present in any response message when DE 39 (Response Code) contains the value 30, indicating that a Format Error condition was detected in the preceding message. In this case, DE 44 will contain either a three- or six-digit value that indicates the data element number (three digits) only or the data element plus subelement numbers (six digits) in which the format error occurred. If the format error occurred in a data element that does not have subelements, DE 44 will contain a three-digit numeric value.

**Plural Form:** DE 44 (Additional Response Data)

**Abbreviation:** DE 44

## DE 45 (Track 1 Data)

DE 45 (Track 1 Data) is the information encoded on track 1 of the card's magnetic stripe as defined in the ISO 7813 specification, including data element separators but excluding beginning and ending sentinels and LRC characters as defined in this data element definition.

**Plural Form:** DE 45 (Track 1 Data)

**Abbreviation:** DE 45

## DE 46 (Expanded Additional Amounts)

DE 46 (Additional Data: ISO Use) provides data supplemental to that already conveyed in the specific data elements in the message.

**Plural Form:** DE 46 (Expanded Additional Amounts)

**Abbreviation:** DE 46

## DE 47 (Additional Data: National Use)

DE 47 (Additional Data—National Use) is reserved for national organizations to define data unique to country applications.

**Plural Form:** DE 47 (Additional Data: National Use)

**Abbreviation:** DE 47

## DE 48 (Additional Data: Private Use)

DE 48 (Additional Data: Private Use) contains data associated with various Mastercard programs, products, and services. DE 48 is used to convey data that is not related to any other ISO-defined data elements. It is a variable-length data element used for multiple purposes.

**Plural Form:** DE 48 (Additional Data: Private Use)

**Abbreviation:** DE 48

## DE 49 (Currency Code, Transaction)

DE 49 (Currency Code, Transaction) is the local currency of the acquirer or source location of the transaction. It specifies the currency used in DE 4 (Amount, Transaction) and DE 95 (Replacement Amounts), subfield 1 (Actual Amount, Transaction).

**Plural Form:** DE 49 (Currency Code, Transaction)

**Abbreviation:** DE 49

## DE 50 (Currency Code, Settlement)

DE 50 (Currency Code, Settlement) defines the currency of DE 5 (Amount, Settlement), DE 29 (Amount, Settlement Fee), and DE 95 (Replacement Amounts), subfield 2 (Actual Amount, Settlement).

**Plural Form:** DE 50 (Currency Code, Settlement)

**Abbreviation:** DE 50

## DE 51 (Currency Code, Cardholder Billing)

DE 51 (Currency Code, Cardholder Billing) defines the currency of DE 6 (Amount, Cardholder Billing), DE 8 (Amount, Cardholder Billing Fee), and DE 95 (Replacement Amounts), subfield 3 (Actual Amount, Cardholder Billing).

**Plural Form:** DE 51 (Currency Code, Cardholder Billing)

**Abbreviation:** DE 51

## DE 52 (Personal ID Number [PIN] Data)

DE 52 (Personal ID Number [PIN] Data) contains a number assigned to a cardholder intended to uniquely identify that cardholder at the point of interaction. The use of the PIN is subject to bilateral agreement. The data element may contain the PIN itself or a derivative. This data element transmits PIN information from acquirers to issuers (or to the network) for PIN verification or validation.

**Plural Form:** DE 52 (Personal ID Number [PIN] Data)

**Abbreviation:** DE 52

## DE 53 (Security-Related Control Information)

DE 53 (Security-Related Control Information) is used with PIN data to provide specific information about PIN block encoding and PIN data encryption to assist the issuer (or its agent) in processing PINs entered at the point of interaction.

**Plural Form:** DE 53 (Security-Related Control Information)

**Abbreviation:** DE 53

## DE 54 (Additional Amounts)

DE 54 (Additional Amounts) provides information on up to three amount types and related account data.

**Plural Form:** DE 54 (Additional Amounts)

**Abbreviation:** DE 54

## DE 55 (Integrated Circuit Card [ICC] System-Related Data)

DE 55 (Integrated Circuit Card [ICC] System-Related Data) contains binary data that only the issuer, the issuer agent, or MDES processes; it is used locally by the payment application on the chip at a chip-capable terminal. This data element is present in chip full-grade transactions and can be present in DSRP transactions.

**Plural Form:** DE 55 (Integrated Circuit Card [ICC] System-Related Data)

**Abbreviation:** DE 55

## DE 56 (Payment Account Data)

DE 56 (Payment Account Data) contains unique, non-financial reference information associated with the PAN or token used to initiate the transaction.

**Plural Form:** DE 56 (Payment Account Data)

**Abbreviation:** DE 56

## DE 57–DE 59 (Reserved for National Use)

DE 57–DE 59 are reserved for future use.

**Plural Form:** DE 57–DE 59 (Reserved for National Use)

**Abbreviation:** DE 57–DE 59

## DE 60 (Advice Reason Code)

DE 60 (Advice Reason Code) indicates to the receiver of an Advice message the specific reason for the transmission of the Advice message.

**Plural Form:** DE 60 (Advice Reason Code)

**Abbreviation:** DE 60

## DE 61 (Point-of-Service [POS] Data)

DE 61 (Point-of-Service [POS] Data) indicates the conditions that exist at the point of service at the time of the transaction. Note that DE 61 supersedes and replaces the ISO-specified DE 25 (Point-of-Service [POS] Condition Code) which is not used in the *Mastercard Network Processing Dual Message Authorization System Guide*.

**Plural Form:** DE 61 (Point-of-Service [POS] Data)

**Abbreviation:** DE 61

## DE 62 (Intermediate Network Facility [INF] Data)

DE 62 (Intermediate Network Facility [INF] Data), contains "acquiring network trace information" that INFs may require to quickly and accurately route Administrative Advice/0620 messages back to the original acquiring institution. DE 62 assists acquiring INF facilities that connect directly to the Dual Message Authorization System. It allows these INFs to maintain sufficient information within a message to permit immediate online routing of chargebacks and retrieval requests without the requirement of maintaining large online reference databases containing the original transactions.

**Plural Form:** DE 62 (Intermediate Network Facility [INF] Data)

**Abbreviation:** DE 62

## DE 63 (Network Data)

DE 63 (Network Data) is generated by the Dual Message Authorization System for each originating message routed through the network. The receiver must retain the data element and use it in any response or acknowledgment message associated with the originating message.

**Plural Form:** DE 63 (Network Data)

**Abbreviation:** DE 63

## DE 64 (Message Authentication Code)

DE 64 (Message Authentication Code [MAC]) validates the source and the text of the message between the sender and the receiver.

**Plural Form:** DE 64 (Message Authentication Code)

**Abbreviation:** DE 64

## DE 65 (Bit Map, Extended)

DE 65 (Bit Map, Extended) is a series of eight bytes (64 bits) used to identify the presence (denoted by 1) or the absence (denoted by 0) of each data element in an extended (third) message segment.

**Plural Form:** DE 65 (Bit Map, Extended)

**Abbreviation:** DE 65

## DE 66 (Settlement Code)

DE 66 (Settlement Code) indicates the result of a reconciliation request.

**Plural Form:** DE 66 (Settlement Code)

**Abbreviation:** DE 66

## DE 67 (Extended Payment Code)

DE 67 (Extended Payment Code) indicates the number of months that the cardholder prefers to pay for an item (the item purchased during the course of this transaction) if permitted by the card issuer.

**Plural Form:** DE 67 (Extended Payment Code)

**Abbreviation:** DE 67

## DE 68 (Receiving Institution Country Code)

DE 68 (Receiving Institution Country Code) is the code of the country where the receiving institution is located.

**Plural Form:** DE 68 (Receiving Institution Country Code)

**Abbreviation:** DE 68

## DE 69 (Settlement Institution Country Code)

DE 69 (Settlement Institution Country Code) is the code of the country where the settlement institution is located.

**Plural Form:** DE 69 (Settlement Institution Country Code)

**Abbreviation:** DE 69

## DE 70 (Network Management Information Code)

DE 70 (Network Management Information Code) identifies network status.

**Plural Form:** DE 70 (Network Management Information Code)

**Abbreviation:** DE 70

## DE 71 (Message Number)

DE 71 (Message Number) is a sequential, cyclic number the message initiator assigns to a message. Message Number is used to monitor the integrity of interchange.

**Plural Form:** DE 71 (Message Number)

**Abbreviation:** DE 71

## DE 72 (Message Number Last)

DE 72 (Message Number Last) is a sequential, cyclic number the message initiator assigns to a message, used to monitor the integrity of interchange.

**Plural Form:** DE 72 (Message Number Last)

**Abbreviation:** DE 72

## DE 73 (Date, Action)

DE 73 (Date, Action) specifies the date (year, month, and day) of a future action. In addition, a message originator may use it as a static time such as a birthdate.

**Plural Form:** DE 73 (Date, Action)

**Abbreviation:** DE 73

## DE 74 (Credits, Number)

DE 74 (Credits, Number) is the numeric sum of credit transactions processed.

**Plural Form:** DE 74 (Credits, Number)

**Abbreviation:** DE 74

## DE 75 (Credits, Reversal Number)

DE 75 (Credits, Reversal Number) is the sum number of reversal credit transactions.

**Plural Form:** DE 75 (Credits, Reversal Number)

**Abbreviation:** DE 75

## DE 76 (Debits, Number)

DE 76 (Debits, Number) is the sum number of debit transactions processed.

**Plural Form:** DE 76 (Debits, Number)

**Abbreviation:** DE 76

## DE 77 (Debits, Reversal Number)

DE 77 (Debits, Reversal Number) is the sum number of reversal debit transactions.

**Plural Form:** DE 77 (Debits, Reversal Number)

**Abbreviation:** DE 77

## DE 78 (Transfers, Number)

DE 78 (Transfers, Number) is the sum number of all transfer transactions processed.

**Plural Form:** DE 78 (Transfers, Number)

**Abbreviation:** DE 78

## DE 79 (Transfers, Reversal Number)

DE 79 (Transfers, Reversal Number) is the sum number of all transfer reversal transactions processed.

**Plural Form:** DE 79 (Transfers, Reversal Number)

**Abbreviation:** DE 79

## DE 80 (Inquiries, Number)

DE 80 (Inquiries, Number) is the sum number of inquiry transaction requests processed.

**Plural Form:** DE 80 (Inquiries, Number)

**Abbreviation:** DE 80

## DE 81 (Authorizations, Number)

DE 81 (Authorizations, Number) is the sum number of Authorization Request/0100 and Authorization Advice/0120 messages processed.

**Plural Form:** DE 81 (Authorizations, Number)

**Abbreviation:** DE 81

## DE 82 (Credits, Processing Fee Amount)

DE 82 (Credits, Processing Fee Amount) is the sum of all processing fees due to an institution or customer for services associated with handling and routing transactions. This Mastercard definition replaces the ISO standard definition.

**Plural Form:** DE 82 (Credits, Processing Fee Amount)

**Abbreviation:** DE 82

## DE 83 (Credits, Transaction Fee Amount)

DE 83 (Credits, Transaction Fee Amount) is the sum of all transaction fees due to an institution or customer for processing interchange transactions. This Mastercard definition replaces the ISO standard definition.

**Plural Form:** DE 83 (Credits, Transaction Fee Amount)

**Abbreviation:** DE 83

## DE 84 (Debits, Processing Fee Amount)

DE 84 (Debits, Processing Fee Amount) is the sum of all processing fees due from an institution or customer for services associated with handling and routing transactions. This Mastercard definition replaces the ISO standard definition.

**Plural Form:** DE 84 (Debits, Processing Fee Amount)

**Abbreviation:** DE 84

## DE 85 (Debits, Transaction Fee Amount)

DE 85 (Debits, Transaction Fee Amount) is the sum of all transaction fees due from an institution or customer for processing interchange transactions. This Mastercard definition replaces the ISO standard definition.

**Abbreviation:** DE 85

## DE 86 (Credits, Amount)

DE 86 (Credits, Amount) is the sum amount of all credit transactions processed exclusive of any fees.

**Plural Form:** DE 86 (Credits, Amount)

**Abbreviation:** DE 86

## DE 87 (Credits, Reversal Amount)

DE 87 (Credits, Reversal Amount) is the sum amount of reversal credits processed exclusive of any fees.

**Plural Form:** DE 87 (Credits, Reversal Amount)

**Abbreviation:** DE 87

## DE 88 (Debits, Amount)

DE 88 (Debits, Amount) is the sum amount of all debit transactions processed exclusive of any fees.

**Plural Form:** DE 88 (Debits, Amount)

**Abbreviation:** DE 88

## DE 89 (Debits, Reversal Amount)

DE 89 (Debits, Reversal Amount) is the sum amount of reversal debits processed exclusive of any fees.

**Plural Form:** DE 89 (Debits, Reversal Amount)

**Abbreviation:** DE 89

## DE 90 (Original Data Elements)

DE 90 (Original Data Elements) is the data elements in the original message, intended to identify a transaction for correction or reversal.

**Plural Form:** DE 90 (Original Data Elements)

**Abbreviation:** DE 90

## DE 91 (Issuer File Update Code)

DE 91 (Issuer File Update Code) indicates to the system maintaining a file which procedure to follow.

**Plural Form:** DE 91 (Issuer File Update Code)

**Abbreviation:** DE 91

## DE 92 (File Security Code)

DE 92 (File Security Code) is an Issuer File Update security code used to indicate that a message originator is authorized to update a file.

**Plural Form:** DE 92 (File Security Code)

**Abbreviation:** DE 92

## DE 93 (Response Indicator)

DE 93 (Response Indicator) indicates the update action a POS system takes.

**Plural Form:** DE 93 (Response Indicator)

**Abbreviation:** DE 93

## DE 94 (Service Indicator)

DE 94 (Service Indicator) indicates the service a message recipient requires.

**Plural Form:** DE 94 (Service Indicator)

**Abbreviation:** DE 94

## DE 95 (Replacement Amounts)

DE 95 (Replacement Amounts) contains the actual amount subfields necessary to perform a partial or full reversal of a financial transaction.

**Plural Form:** DE 95 (Replacement Amounts)

**Abbreviation:** DE 95

## DE 96 (Message Security Code)

DE 96 (Message Security Code) is a verification between an acceptor and a card issuer that a message is authorized to update or modify a special file.

**Plural Form:** DE 96 (Message Security Code)

**Abbreviation:** DE 96

## DE 97 (Amount, Net Settlement)

DE 97 (Amount, Net Settlement) is the net value of all gross amounts.

**Plural Form:** DE 97 (Amount, Net Settlement)

**Abbreviation:** DE 97

## DE 98 (Payee)

DE 98 (Payee), is the third-party beneficiary in a Payment Transaction.

**Plural Form:** DE 98 (Payee)

**Abbreviation:** DE 98

## DE 99 (Settlement Institution ID Code)

DE 99 (Settlement Institution ID Code) identifies the settlement institution or its agent.

**Plural Form:** DE 99 (Settlement Institution ID Code)

**Abbreviation:** DE 99

## DE 100 (Receiving Institution ID Code)

DE 100 (Receiving Institution ID Code) is the identity of the institution receiving a Request or Advice message in an interchange system if not the same as identified in DE 2 (Primary Account Number [PAN]) or DE 34 (Primary Account Number [PAN], Extended). The Dual Message Authorization System uses DE 100 to determine the destination routing of Administrative/06xx messages. For these messages, DE 33 (Forwarding Institution ID Code) identifies the sender of the message; DE 100 identifies the receiver of the message.

**Plural Form:** DE 100 (Receiving Institution ID Code)

**Abbreviation:** DE 100

## DE 101 (File Name)

DE 101 (File Name) is the actual or abbreviated name of the file that the issuer accesses. DE 101 is used in Issuer File Update/03xx messages to identify the specific name of a Dual Message Authorization System data file or program parameter table that is being updated by a customer's Issuer File Update Request/0302.

**Plural Form:** DE 101 (File Name)

**Abbreviation:** DE 101

## DE 102 (Account ID 1)

DE 102 (Account ID-1) is a series of digits that identify a customer account or relationship. Customers primarily use it for the from account in a transfer transaction. DE 102 may be used in Authorization Request Response/0110 messages to identify the specific from account that the transaction affected. DE 102 may be used for printing on cardholder transaction receipts.

**Plural Form:** DE 102 (Account ID 1)

**Abbreviation:** DE 102

## DE 103 (Account ID 2)

DE 103 (Account ID-2) is a series of digits that identify a customer account or relationship. Customers primarily use it for the "to" account in a transfer transaction.

**Plural Form:** DE 103 (Account ID 2)

**Abbreviation:** DE 103

## DE 104 (Digital Payment Data)

DE 104 (Digital Payment Data) is used in Authorization Request/0100 messages to send digital payment data for e-commerce transactions.

**Plural Form:** DE 104 (Digital Payment Data)

**Abbreviation:** DE 104

## DE 105 (Multi-Use Transaction Identification Data)

DE 105 is alphanumeric, variable length using a tag-length-data encoding scheme to allow for easy addition of new subelements.

**Plural Form:** DE 105 (Multi-Use Transaction Identification Data)

**Abbreviation:** DE 105

## DE 106 (Fleet Service Data)

DE 106 (Fleet Service Data) contains information pertaining to Fleet card transactions and the items being purchased.

**Plural Form:** DE 106 (Fleet Service Data)

**Abbreviation:** DE 106

## DE 107 (Reserved for Mastercard Use)

DE 107 (Reserved for Mastercard Use) is reserved for Mastercard use.

**Plural Form:** DE 107 (Reserved for Mastercard Use)

**Abbreviation:** DE 107

## DE 108 (Additional Transaction Reference Data)

DE 108 (Additional Transaction Reference Data) provides the capability for the acquirers to send sender, receiver, and transaction level data to the issuer in Mastercard Send Transactions (Funding Transactions, Mastercard Send Payment Transactions, Gaming and Gambling Payments Transactions), Mastercard Merchant Presented QR Transactions, and Visa Account Funding Transactions.

**Plural Form:** DE 108 (Additional Transaction Reference Data)

**Abbreviation:** DE 108

## DE 109 (Reserved for ISO Use)

DE 109 (Reserved for ISO Use) is reserved for ISO use.

**Plural Form:** DE 109 (Reserved for ISO Use)

**Abbreviation:** DE 109

## DE 110 (Additional Data-2)

DE 110 (Additional Data-2) is reserved for use based on product type.

**Plural Form:** DE 110 (Additional Data–2)

**Abbreviation:** DE 110

## DE 110 (Encryption Data)

DE 110 (Encryption Data) is used in PIN encryption data and key management encryption data.

**Plural Form:** DE 110 (Encryption Data)

**Abbreviation:** DE 110

## DE 111 (Reserved for ISO Use)

DE 111 (Reserved for ISO Use) is reserved for ISO use.

**Plural Form:** DE 111 (Reserved for ISO Use)

**Abbreviation:** DE 111

## DE 112 (Additional Data [National Use])

DE 112 (Additional Data [National Use]) is reserved for national organizations to define data unique to specific networks or specific programs and services. DE 112 provides other supplemental data in a message when a specific ISO-designated data element is not available. It is a free-format, variable-length, alphanumeric data element used for information on transactions between customers.

**Plural Form:** DE 112 (Additional Data [National Use])

**Abbreviation:** DE 112

## DE 113 (Reserved for National Use)

DE 113 (Reserved for National Use) is reserved for national organizations to define data unique to specific networks or specific programs and services.

**Plural Form:** DE 113 (Reserved for National Use)

**Abbreviation:** DE 113

## DE 114 (Reserved for National Use)

DE 114 (Reserved for National Use) is reserved for national organizations to define data unique to specific networks or specific programs and services.

**Plural Form:** DE 114 (Reserved for National Use)

**Abbreviation:** DE 114

## DE 115 (Reserved for National Use)

DE 115 (Reserved for National Use) is reserved for national organizations to define data unique to specific networks or specific programs and services.

**Plural Form:** DE 115 (Reserved for National Use)

**Abbreviation:** DE 115

## DE 116 (Reserved For National Use)

DE 116 (Reserved for National Use) is reserved for national organizations to define data unique to specific networks or specific programs and services.

**Plural Form:** DE 116 (Reserved For National Use)

**Abbreviation:** DE 116

## DE 117 (Reserved for National Use)

DE 117 (Reserved for National Use) is reserved for national organizations to define data unique to specific networks or specific programs and services.

**Plural Form:** DE 117 (Reserved for National Use)

**Abbreviation:** DE 117

## DE 118 (Reserved for National Use)

DE 118 (Reserved for National Use) is reserved for national organizations to define data unique to specific networks or specific programs and services.

**Plural Form:** DE 118 (Reserved for National Use)

**Abbreviation:** DE 118

## DE 119 (Additional Data: Private Use 2)

DE 119 (Additional Data: Private Use 2) contains data associated with various Mastercard programs, products, and services. DE 119 is used to convey data that is not related to any other ISO-defined data elements. It is a variable-length data element used for multiple purposes.

**Plural Form:** DE 119 (Additional Data: Private Use 2)

**Abbreviation:** DE 119

## Using DE 113–119 in Administrative 06xx Messages

The following information explains how to use DE 113–119 in Administrative 0600/0610 messages. Mastercard recommends that the contents of DE 113–119 from the 0600 message not be returned in the 0610 message to avoid the maximum message length constraint of 8k bytes.

**Plural Form:** Using DE 113–119 in Administrative 06xx Messages

**Abbreviation:** Using DE 113–119

## DE 120 (Record Data)

DE 120 (Record Data) is a variable-length data element used for transmitting file record data or textual character string data in various message types.

**Plural Form:** DE 120 (Record Data)

**Abbreviation:** DE 120

## DE 121 (Authorizing Agent ID Code)

DE 121 (Authorizing Agent ID Code), when used, must contain the appropriate Mastercard-assigned customer ID number that uniquely identifies the Dual Message Authorization System Stand-In Authorization facility or alternate routing customer responsible for performing Stand-In Authorization on-behalf of the issuer.

**Plural Form:** DE 121 (Authorizing Agent ID Code)

**Abbreviation:** DE 121

## DE 122 (Additional Record Data)

DE 122 is a free-format, variable-length data element used for transmitting file record data in various message types.

**Plural Form:** DE 122 (Additional Record Data)

**Abbreviation:** DE 122

## DE 123 (Receipt Free Text)

DE 123 (Receipt Free Text) only applies to the Swedish Domestic Authorization Switching Service (SASS), Peru, and the Mastercard Installment Payment Service. For SASS, DE 123 contains information to be printed on a receipt (not displayed on the terminal screen) for balance inquiry and ATM transactions (where DE 3 [Processing Code] is value 01 [Withdrawal] or value 30 [Balance Inquiry]). For Peru and Mastercard Installment Payment Service, DE 123 contains a text message to be printed on point-of-sale (POS) sales receipts.

**Plural Form:** DE 123 (Receipt Free Text)

**Abbreviation:** DE 123

## DE 124 (Member-Defined Data)

DE 124 (Member-defined Data) is described for general use and Prepaid Voucher, Brazil Maestro only, Bill Payment at the ATM only, and Mastercard Digital Enablement Service use.

**Plural Form:** DE 124 (Member-Defined Data)

**Abbreviation:** DE 124

## DE 125 (New PIN Data)

DE 125 (New PIN Data) consists of a binary block containing a derived encrypted value calculated from the new PIN introduced by the cardholder at the ATM offering the PIN change service.

**Plural Form:** DE 125 (New PIN Data)

**Abbreviation:** DE 125

## DE 126 (Private Data)

DE 126 (Private Data) is reserved for future use.

**Abbreviation:** DE 126

## DE 127 (Private Data)

DE 127 (Private Data) may contain any private-use data that the customer may want to include in a message. Any Authorization System message originator may use DE 127.

**Plural Form:** DE 127 (Private Data)

**Abbreviation:** DE 127

## DE 128 (Message Authentication Code)

DE 128 (Message Authentication Code [MAC]) validates the source and the text of the message between the sender and the receiver.

**Plural Form:** DE 128 (Message Authentication Code)

**Abbreviation:** DE 128
