## Retrieval Request/1644-603 messages

This section contains the error numbers and message texts by field and subfield for Retrieval Request/1644-603 messages.

### Retrieval Request/1644-603

Error numbers and message texts are organized by field and subfield for Retrieval Request/1644-603 messages. The edit process that presents the message is performed by the Clearing Optimizer software, the Global Clearing Management System (GCMS), or both.

#### MTI/Function Code: Retrieval Request/1644-603

| Field/<br>Subfield | Error<br>number | Error message                                                                                                                                                                | Edit<br>perform<br>ed by... |

## Retrieval Request Acknowledgment/1644–605 messages

This chapter contains the error numbers and message texts by field and subfield for Retrieval Request Acknowledgment/1644–605 messages.

### Retrieval Request Acknowledgment/1644–605

Error numbers and message texts are organized by field and subfield for Retrieval Request Acknowledgment/1644–605 messages. The edit process that presents the message is performed by the Clearing Optimizer software, the Global Clearing Management System (GCMS), or both.

#### MTI/Function Code: Retrieval Request Acknowledgment/1644–605

| Field/<br>Subfield | Error<br>number | Error message                                         | Edit<br>perform<br>ed by... |
|--------------------|-----------------|-------------------------------------------------------|-----------------------------|

## First Chargebacks (Full)/1442-450 and (Partial)/1442-453 messages

This section contains the error numbers and message texts by field and subfield for First Chargebacks (Full)/1442-450 and (Partial)/1442-453 messages.

### First Chargebacks (Full)/1442-450 and (Partial)/1442-453

Error numbers and message texts are organized by field and subfield for First Chargebacks (Full)/1442-450 and (Partial)/1442-453 messages. The edit process that presents the message is performed by the Clearing Optimizer software, the Global Clearing Management System (GCMS), or both.

#### MTI/Function Code: First Chargebacks (Full)/1442-450 and (Partial)/1442-453

## Second Presentment (Full)/1240-205, and (Partial)/1240-282 messages

This chapter contains the error numbers and message texts by field and subfield for Second Presentment (Full)/1240-205, and (Partial)/1240-282 messages.

### Second Presentment (Full)/1240-205, and (Partial)/1240-282

Error numbers and message texts are organized by field and subfield for Second Presentment (Full)/1240-205 and (Partial)/1240-282 messages. The edit process that presents the

message is performed by the Clearing Optimizer software, the Global Clearing Management System (GCMS), or both.

**MTI/Function Code: Second Presentment (Full)/1240-205 and (Partial)/1240-282**

## Fee Collection (Other)/1740-700, 780, 781, and 782 messages

This chapter contains the error numbers and message texts by field and subfield for Fee Collection (Other)/1740-700, 780, 781, and 782 messages.

### Fee Collection (Other)/1740-700, 780, 781, and 782

Error numbers and message texts are organized by field and subfield for Fee Collection (Other)/1740-700, 780, 781, and 782 messages. The edit process that presents the message is performed by the Clearing Optimizer software, the Global Clearing Management System (GCMS), or both.

#### MTI/Function Code: Fee Collection (Other)/1740-700, 780, 781, and 782

## Duplicate Dual Message Clearing System files, postings, and potential duplicate rejects

A duplicate file occurs when the [Dual Message Clearing System](#) processes a file more than once. The Dual Message Clearing System has edits and built-in controls to detect and reject complete duplicate files or individual transactions when submitted by acquirers. A potential duplicate transaction reject occurs when the Dual Message Clearing System detects the transaction is a potential duplicate of a transaction that was previously processed.

### Dual Message Clearing System editing for duplicate files

To prevent a duplicate file from being processed, the Dual Message Clearing System rejects the entire file if PDS 0105 (File ID) in the File Header/1644 message matches one that was processed within the last 180 days for the customer or processor (specified in PDS 0105, subfield 3 [Processor ID]).

For example, suppose that customer 1234 sends file ID number 0022504150000000123400001. If the Dual Message Clearing System File ID History File contains the same file ID number within the last 180 days of file IDs from customer 1234, the Dual Message Clearing System rejects that second file 0022504150000000123400001 as a duplicate file.

## **Reasons for duplicate Dual Message Clearing System files or postings**

Duplicate postings may occur for various reasons, such as:

- An operator changes the file ID number on a previously processed file and resends it
- Previously processed merchant transactions are processed again, or
- The merchant submits the same transaction more than once

Mastercard recommends that customers establish controls to prevent and detect these and other errors to help prevent duplicate files and postings.

## **Identification of duplicate Dual Message Clearing System postings**

If a duplicate posting does occur, either the sending customer or the receiving customer may identify it.

If the receiving customer discovers a duplicate posting, it must notify the sending customer. The sending customer must inform the Mission Control and Operations Command Center by telephone and then take action to correct the duplicate postings by submitting reversals.

When the sending customer notifies Mastercard about a duplicate posting, the customer must provide for both the original and duplicated postings the following:

- File ID numbers
- Net amounts

## **Potential duplicate clearing transaction rejections**

The Dual Message Clearing System rejects 1240/200 First Presentment transactions if it is determined to be a potential duplicate of a previously processed transaction. A specific process must be followed to resubmit the transaction if the acquirer determines the transaction not to be a duplicate.

### **Potential duplicate rejection**

Mastercard has logic designed to identify potential duplicate First Presentment/1240/200 clearing messages by performing matching logic against the associated authorization message, and a comparison against other 1240/200 messages. There will be occasions where a false-positive is identified. When those instances occur, acquirers have the ability to resubmit the rejected clearing message.

Mastercard's goal is to reject as many potential duplicate clearing messages as possible, but issuers might still receive some duplicate clearing messages.

Acquirers receive 1644/691 rejection messages indicating the transaction rejected due to a potential duplication.

### Potential duplicate resubmission process

A rejected transaction that is verified to be a non-duplicate can be reprocessed by retaining and returning information from the reject message. PDS 0444: Resubmission Code will be included in the Message Exception/1644 message. PDS 0444 contains a resubmission code that must be included in any resubmitted First Presentment/1240 message that was previously identified as a potential duplicate. The presence of a valid value in PDS 0444 allows the resubmitted First Presentment/1240 message to bypass the potential duplicate detection and rejection process.

Mastercard accommodates the additional time taken to receive, research, and respond to rejected potential duplicate clearing transactions. Resubmitted First Presentment/1240 messages that contain a valid resubmission code are not subject to any interchange program timeliness requirements that may be required to qualify for some interchange programs.

As a reminder, Mastercard can identify up to 10 error codes, which are reasons for which a transaction is being rejected. Acquirers must ensure they are not only submitting PDS 0444 on the resubmission, but also that they are correcting any other identified reasons for which the transaction was rejected.

## Full File Reversal Utility

The IPM File Reversal Utility can be used for building a full file reversal.

### About IPM File Reversal Utility

Customers inadvertently send duplicate [IPM](#) clearing files to Mastercard, and it is critical that the duplicate files are reversed quickly to avoid processing and financial impact. To reverse the duplicated files, customers can use the IPM file reversal utility to easily create a full file reversal and validate the file using the Clearing Optimizer software before submitting the clearing file to Mastercard.

For example, if a customer inadvertently sent duplicate clearing files for [Dual Message Clearing System](#) processing date 29 August 2024, the impacted customer can now use the IPM file reversal utility to create a full file reversal using the processing date of 29 August 2024.

The IPM file reversal utility inserts PDS 0026 (File Reversal Indicator) in the file header with the information provided from the processing date on the Reversal Processing Date Selection field. Using the noted example, the values in PDS 0026 will be PDS 0026, subfield 1 (File Reversal Indicator) = R and PDS 0026, subfield (Central Site Processing Date of Original File) = 190829.

**NOTE: The IPM file reversal utility can be used on a clearing file with one header and one trailer. Clearing files with multiple logical files (multiple headers and trailer) cannot be used.**

For more information regarding reversals and PDS 0026, refer to [PDS 0026 \(File Reversal Indicator\)](#). It is critical to select the correct processing date for the reversal files and validate the reversal files before submitting the files to the Mastercard central site.

## Having Mastercard reverse files

Mastercard submits full file reversals at the customer's request.

Customers that want to request this service must provide the File ID of the file to be reversed and the original [Dual Message Clearing System](#) processing date of that file to their Global Customer Service team, regional office representative, or Technical Account Management representative. Mastercard uses this information to create and submit a full-file reversal as documented in the [How to send reversal files: full files](#) section.

## Editing reversal messages

The [Dual Message Clearing System](#) automatically excludes reversal messages from most interchange qualification edits. For example, the Dual Message Clearing System excludes reversal First Presentment/1240 messages from interchange timeliness and industry-related addendum requirements.

The Dual Message Clearing System does edit the file ID in all full-file reversals to ensure that it has not been previously reversed. As noted, the file ID in a reversal file does not have to be the original file ID, but it cannot be a file ID that has been used in a previous full-file reversal.

## Reporting reversal rejects

The [Dual Message Clearing System](#) generates Message Exception/1644 or File Reject/1644 messages for all rejected messages or files. Within these error messages, the Dual Message Clearing System designates reversal transactions by the presence of PDS 0025 (Message Reversal Indicator) in the individual message for individual transaction reversals and PDS 0026 (File Reversal Indicator) in the header message for full file reversals.

## Chapter 7 System functionality and services

*This section describes functionality or services that are fundamental to clearing processing. This section also includes information about requesting and using these services.*

## Automated fuel dispenser completion

*Automated Fuel Dispensers (AFDs)* are self-service fuel pumps equipped with card payment systems at fuel stations, enabling the cardholder to purchase fuel without requiring an attendant. AFDs preauthorize a fixed amount, then the acquirer sends an authorization advice and clearing for the final purchase amount.

AFD merchants authorize a fuel transaction from an unattended pump by submitting the preauthorization amount as either one unit of currency (1.00), or a maximum amount. The "1.00 AFD" method is used in countries that have established chargeback liability limits for AFD transactions (for example, USD 100 in the U.S. region).

Acquirers use the Authorization Advice/0120 messages to advise the issuer of the total amount of the AFD transaction. Acquirers then submit a clearing record to the Dual Message Clearing System for the amount in the authorization advice.

An AFD transaction is identified with MCC 5542 and may have occurred at a *cardholder activated terminal (CAT)* or as an e-commerce transaction.

**NOTE: The *Data Integrity Monitoring Program* guide describes the Data Integrity AFD edit for acquirers of AFD merchants that are located in the U.S. region.**

## Bilateral settlement activity

This section describes what bilateral settlement is and how the *Dual Message Clearing System* processes these transactions.

### Definition of bilateral settlement agreement

A bilateral settlement agreement is an arrangement between two Mastercard customers to settle transactions directly, rather than through the Mastercard *Settlement Account Management (S.A.M.)* system.

If this arrangement is in place, Mastercard clears transaction data between the participating customers but does not perform settlement on the data.

Customers interested in establishing a bilateral settlement agreement with other customers should contact their Global Customer Service team.

**NOTE: For more information about participation in bilateral agreements, refer to the *Settlement Manual*.**

## Identification of bilateral settlement transactions

Customers requesting bilateral settlement for a given transaction must indicate this by populating PDS 0165 (Settlement Indicator), subfield 1 (Settlement Indicator) with a value of B to denote bilateral settlement.

This causes the Dual Message Clearing System to edit and clear the transactions but not initiate settlement. Customers may combine bilateral transactions with all other transactions in the same file.

These customers may also optionally populate PDS 0165, subfield 2 (Settlement Agreement Information) with additional information related to the bilateral settlement.

## Editing bilateral transactions

The Dual Message Clearing System edits bilateral settlement transactions to ensure that a bilateral settlement agreement is on file between the sending and receiving Customer IDs.

Tables indicating bilateral settlement agreements and customer participation are available in the [IPM Mastercard Parameter Extract \(MPE\)](#).

The Dual Message Clearing System automatically excludes bilateral settlement chargeback transactions from:

- Chargeback timeliness edits
- Cycle appropriateness edits

## Bilateral transactions in relation to reconciliation messages

For information on bilateral transactions in relation to reconciliation messages, refer to the [Bilateral transactions in relation to reconciliation messages](#) section in the Reconciliation chapter.

## Business service arrangements

This section defines business service arrangements and describes the types of business service options Mastercard offers.

## Definition of business service

A business service is an arrangement with Mastercard between two or more customers that defines customized business rules and interchange processing requirements for transactions occurring between the participating customers. This arrangement must be consistent with Mastercard Standards or the standards of the other applicable brand.

Within each business service arrangement, Mastercard defines a set of qualification criteria and editing rules for each card program identifier. Card program identifiers include any of the Mastercard family of brands, including, but not limited to, Mastercard, Cirrus, and Maestro.

Mastercard may agree to add additional brands (that are not Mastercard brands) as business needs dictate.

Business service criteria, editing rules, interchange fee structures, and all other qualification criteria are parameter-based and maintained in tables. Business service arrangement parameters are maintained within Mastercard's internal parameter system and are reflected in the Dual Message Clearing System MPE.

**NOTE: Most major changes, such as changes that affect all customers globally or all customers within a specific region, are implemented in a standard release schedule.**

**NOTE: For further information on initiating a business service arrangement, contact the Global Customer Service team or the appropriate Mastercard regional office.**

## Types of business service arrangements

There are six types of business service arrangements, each with a defined hierarchy or priority to determine how the system processes transactions. Customers can participate in multiple business service arrangements under a single Customer ID.

All customers participate in a minimum number of business service arrangements to facilitate activity within their region as well as interregional activity. Customers may also participate in additional business service arrangements where relevant.

Mastercard defines the types of arrangements in the following table.

### Types of Arrangements

| Business service arrangement                                                                                                                                                                                                           | Description                                                                                                                                       | System selection hierarchy | Geography | Arrangement type code (PDS 0158s2) |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------|-----------|------------------------------------|
| Customer-to-Customer                                                                                                                                                                                                                   | An arrangement involving a pair of customers, or group of customers (this business service type has no geographic or business region boundaries). | First priority             | None      | 8                                  |
| <b>NOTE: If both Business-to-Business and Customer-to-Customer Business Service arrangements are valid, then the Customer-to-Customer Business Service Arrangement has priority over the Business-to-Business Service Arrangement.</b> |                                                                                                                                                   |                            |           |                                    |

| Business service arrangement        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | System selection hierarchy | Geography                        | Arrangement type code (PDS 0158s2) |

| Business-to-Business                | An arrangement between all the customers ( <i>acquirers</i> and <i>issuers</i> ) that participate in a given business initiative. The interchange is defined by Mastercard. This business service type has no geographic or business region boundaries.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | First priority             | None                             | 8                                  |
| Intracountry                        | An arrangement involving all customers within a single country.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Second priority            | Single Country                   | 4                                  |
| Intercountry (formerly Subregional) | An arrangement involving customers in multiple countries or business regions. Participants are not required to be within a single business region.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Third priority             | Two or more Countries or Regions | 3                                  |
| Intraregional                       | An arrangement involving all customers within a business region.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Fourth priority            | Single Region                    | 2                                  |
| Interregional                       | <p>An arrangement involving all customers in different business regions.</p> <p>The geographic designation for interregional arrangements consists of a "from" region and a "to" region:</p> <ul style="list-style-type: none"> <li>The "from" region is defined as the region associated to the value in <i>data element (DE) 31</i> (Acquirer Reference Data), subfield 2 (Acquirer Reference ID), or in the absence of DE 31, the value in DE 94 (Transaction Originator Institution ID Code) of the message.</li> <li>The "to" region is defined as the region associated to the value in the DE 2 (Primary Account Number [PAN]), or in the absence of DE 2 the value in DE 93 (Transaction Destination Institution ID Code) of the message</li> </ul> <p>When the acquirer and issuer are in the same region and the merchant is in a different region, the "from" region is defined as the region associated to the merchant identified in DE 43 (Acceptor Name/ Location), subfield 6 (Acceptor Country Code).</p> | Fifth priority             | Two Regions: From and To         | 1                                  |

**NOTE: Business service arrangements are established in accordance with local laws and regulations. For questions about participation in, or the hierarchy of business arrangement qualification, contact your Mastercard representative.**

## Criteria details

Interchange rate designators (IRDs) are defined within the arrangement, each with its own unique set of qualification criteria and corresponding interchange fee structure. The criteria available for customization within an arrangement are described in the following table.

### Criteria Details

| Qualification Criteria                               | Description                                                                                                                                                                                                                                                                                                                                                                                            |
|------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Card Program Identifier                              | The set of card program identifiers in PDS 0158 (Business Activity), subfield 1 (Card Program Identifier) that are valid for the arrangement. Each of the remaining business service setup parameters have unique values for each card program identifier.                                                                                                                                             |
| Global Clearing Management System Product Identifier | The set of clearing product codes in PDS 0002 (Global Clearing Management System Product Identifier), derived from DE 2 (Primary Account Number [PAN]) that are valid for the card program identifier within the business service arrangement.                                                                                                                                                         |
| Transaction Function                                 | The set of transaction functions (Message Type Identifier plus DE 24 [Function Code]) that are valid for the card program identifier within the business service arrangement.                                                                                                                                                                                                                          |
| Processing Code/<br>Reversal Indicator               | The set of Processing Codes in DE 3 (Processing Code), subfield 1 (Cardholder Transaction Type) that is valid for each transaction function established for the card program identifier within the business service arrangement. Also defines whether reversals as identified in PDS 0025 (Message Reversal Indicator), subfield 1 (Message Reversal Indicator) are permitted for the processing code. |
| Cardholder From Account ID                           | The set of Cardholder From Account ID codes in DE 3 (Processing Code), subfield 2 (Cardholder From Account Type Code) that is valid for each transaction function established for the card program identifier within the business service arrangement.                                                                                                                                                 |
| Cardholder To Account ID                             | The set of Cardholder To Account ID codes in DE 3 (Processing Code), subfield 3 (Cardholder To Account Type Code) that is valid for each transaction function established for the card program identifier within the business service arrangement.                                                                                                                                                     |

| Qualification Criteria                      | Description                                                                                                                                                                                                                          |
|---------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Message Reason Codes/<br>Reversal Indicator | The set of Message Reason Codes in DE 25 (Message Reason Code) that is valid for each card program identifier within the business service arrangement. Defines whether reversals are permitted for the <a href="#">reason code</a> . |
| Geography                                   | The valid geographical usage for the brand, expressed as a set of valid regions, country codes, or a combination of both.                                                                                                            |
| Acceptor Business (AB)<br>Programs          | The set of AB programs that are valid for each card program identifier within the business service arrangement.                                                                                                                      |

## Additional features for business service arrangements

Options such as timeliness editing and authorization code requirements may be defined for a business service. In addition, interchange fee structures and optional addendum message requirements must be defined for transactions to be exchanged within the arrangement.

### Business service calendar and transaction timeliness

A business service calendar is established by the participants of each arrangement, defining the processing days and holidays to be observed within the arrangement. The Dual Message Clearing System uses the information in the calendar for calculating transaction timeliness, when applicable.

If requested, the Dual Message Clearing System performs transaction timeliness editing according to the number of days permitted, considering any excluded days as specified in the business service calendar. Several types of dates may be excluded from the interchange timeliness calculation, such as:

- Non-processing days (holidays)
- Holidays
- Transaction date
- File header date

**NOTE: When two or more conditions occur on the same day (for example, Holiday = excluded date, and Processing Date = not excluded), exclusions take precedence, and the day will not be counted in the timeliness calculation.**

## Interchange rates and fees structure

Customer arrangements define, in accordance with Mastercard Standards, [interchange rate designators \(IRDs\)](#) and corresponding interchange rate structures to be applied to transactions exchanged between participating customers.

In addition, participating customers can specify whether the [Dual Message Clearing System](#) should calculate interchange fees for bilaterally settled transactions that qualify for the business service. For more information about bilaterally settled transactions, refer to the *Settlement Manual*.

## Manual cash disbursement accommodation fee

Customers that participate in an intracountry business service arrangement may establish an accommodation fee for manual (non-ATM) cash disbursements. The issuer pays an accommodation fee to the acquirer for transactions involving a manual (non-ATM) cash disbursement.

Customer-defined manual cash disbursement fees may be calculated as a percentage of the transaction amount, a unit fee in local currency or U.S. dollars, a minimum cash disbursement accommodation fee, or any combination thereof.

**NOTE: Customers that require additional assistance to support unique local requirements should contact the appropriate regional office.**

## Contents of PDS 0158 (Business Activity)

The [Dual Message Clearing System](#) selects or validates the values in PDS 0158 (Business Activity) for each applicable financial transaction.

The first four subfields are:

### Subfields

| Subfield | Description                            | Definition                                                                                                                | For example... |   |                  |
|----------|----------------------------------------|---------------------------------------------------------------------------------------------------------------------------|----------------|---|------------------|
| 1        | Card Program Identifier                | Three-position code that identifies Mastercard or other applicable brand under whose umbrella transactions are processed. | MCC            | = | Mastercard® Card |
| 2        | Business Service Arrangement Type Code | One-position code that identifies the interchange relationship for the business arrangement.                              | 2              | = | Intraregional    |

| Subfield | Description                 | Definition                                                                                                  | For example...                                     |
|----------|-----------------------------|-------------------------------------------------------------------------------------------------------------|----------------------------------------------------|
| 3        | Business Service ID Code    | Unique, six-position code that identifies the specific interchange arrangement assigned to the transaction. | 010001 = U.S. intraregional business service       |
| 4        | Interchange Rate Designator | Code that specifies the interchange rate to apply to the transaction.                                       | 70 = U.S. intraregional Merit III interchange rate |

When sending transactions to the Dual Message Clearing System, customers must submit an interchange rate designator (IRD) in subfield 4 and may populate subfields 1, 2, and 3 with either spaces or the appropriate business service data. The Dual Message Clearing System rejects any transaction that contains invalid data in PDS 0158, subfields 1 through 4. For all other valid transactions, the Dual Message Clearing System populates subfields:

- 1, 2, and 3 with the system-selected information
- 5 through 12 of PDS 0158 before forwarding the transaction to the receiving customer.

The Dual Message Clearing System derives the information according to evaluation of the message contents against the qualification criteria for business service arrangements in common between the acquirer and issuer. If the Dual Message Clearing System cannot find a business service in which to process the transaction, the Dual Message Clearing System rejects the transaction.

For more information, refer to PDS 0158 in [Data element and private data subelement definitions and details](#).

## Claims Manager

Mastercom® Claims Manager offers complete end-to-end functionality for processing and managing disputes.

Claims Manager groups dispute events related to a single first presentment under a single claim, allowing the acquirers and issuers to track the progress of the claim through the dispute resolution cycle. Claims Manager groups the claims into queues according to their progress in the dispute resolution cycle.

Claims Manager supports the following use cases for the Dual Message System disputes.

## Dispute use cases

| Entity             | Use case                                                                                                                                                                                                                                                                                                                                                |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Issuer             | <ul style="list-style-type: none"> <li>• Research a first presentment and open a claim.</li> <li>• Create a collaboration request manually (claims for transactions involving U.S. healthcare only).</li> <li>• Create a first chargeback.</li> <li>• Receive a second presentment.</li> <li>• Create a pre-arbitration or arbitration case.</li> </ul> |
| Acquirer           | <ul style="list-style-type: none"> <li>• View claims created by the issuer.</li> <li>• Receive and respond to a collaboration request.</li> <li>• Receive a first chargeback.</li> <li>• Create a second presentment.</li> <li>• Receive a pre-arbitration or arbitration case.</li> </ul>                                                              |
| Acquirer or issuer | <ul style="list-style-type: none"> <li>• Add supporting documentation to a dispute event.</li> <li>• Create a pre-compliance or compliance case.</li> <li>• Send and receive a fee collection message.</li> <li>• Generate reports.</li> </ul>                                                                                                          |

Claims Manager submits dispute events to the [Dual Message Clearing System](#) on behalf of the acquirers and issuers. For more information on Claims Manager, see the *Mastercom User Guide*.

## Currency conversion

This section describes the currency conversion process, including how the Dual Message Clearing System calculates and rounds amounts during currency conversion.

### Overview of currency conversion service performed during the clearing process

Currency conversion is a service that Mastercard performs to convert transaction amounts to cardholder billing amounts and reconciliation amounts whenever the transaction currency is different from the currency of the cardholder or the currency of reconciliation.

This process enables customers to:

- Acquire transactions in multiple currencies and issue cards that are billed in the currencies preferred by [cardholders](#). For each transaction, Mastercard converts the acquired transaction amounts from the transaction currency to the issuer-designated cardholder billing currency.
- Settle in currencies that best align with the local business practices of the acquirers and issuers.

Mastercard buys and sells currencies to support settlement in multiple currencies for customers. Mastercard uses currency conversion rates for calculating acquirer and issuer reconciliation amounts.

Mastercard guarantees the Mastercard-issued currency conversion rates for each supported currency. See the definitions in the following table.

### Currency conversion definitions

| Term                          | Description                                                                                                                          |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------|
| Base Amount                   | Transaction amount converted to U.S. dollars.                                                                                        |
| Computed Cross Rates          | An exchange rate between two non-U.S. dollar currencies is computed by reference to the U.S. dollar.                                 |
| Mastercard-issued Cross Rates | Buy, mid, and sell rates for certain non-U.S. dollar currency pairs set by Mastercard (applies to regional settlement service only). |
| Mastercard-issued USD Rates   | Buy, mid, and sell rates against the U.S. dollar set by Mastercard.                                                                  |
| Reference Currency            | Reference currency is quoted as one unit per a certain amount of foreign currency.                                                   |

**NOTE: Currency conversion and foreign exchange are used interchangeably in the context of the information presented in this section.**

### Amount definitions

Cardholder billing amount and transaction amount are defined here:

- Cardholder billing amount (DE 6): The cardholder billing amount is the transaction amount in the currency that has been designated as the cardholder billing currency by the issuer, which Mastercard transmits to the issuer in this data element. Issuers have the relationship with the cardholder and determine the eventual billing to the cardholder.
- Transaction amount (DE 4): Mastercard transmits the transaction amount. The transaction amount is in the currency appearing on the [Transaction information document \(TID\)](#) in a first presentment. If no currency is identified on the TID, the transaction is deemed to have occurred in the currency that is legal tender at the point of interaction.

### Rates used for currency conversion

Except as otherwise provided in the Mastercard Standards, Mastercard converts all transaction amounts processed through the [Dual Message Clearing System](#) into the equivalent reconciliation currency amount for settlement. When necessary, Mastercard converts the transaction using

the appropriate rates to calculate acquirer reconciliation, cardholder billing, and issuer reconciliation amounts.

### **Mastercard-issued USD rates**

The Mastercard-issued USD Rates support currency conversion involving currencies that are managed against the U.S. dollar. In this case, the U.S. dollar is considered as the reference currency. With this manual, the Rate Class M (value M) description indicates that a Mastercard-issued USD rate was used in the currency conversion process (for example, to convert from the transaction currency to the cardholder billing and/or reconciliation currency).

For all Mastercard-issued USD rates, the U.S. dollar is the reference currency whereby the rates are quoted in units of foreign currency per U.S. dollar.

### **Mastercard-issued cross rates**

The Mastercard-issued cross rates support currency conversion involving currencies that are managed against currencies other than the U.S. dollar. For each cross rate, there is a non-U.S. dollar reference currency (for example, EUR and GBP) whereby the cross rates are quoted in units of foreign currency per reference currency. The Rate Class F (value F) indicates that a Mastercard-issued cross rate was used in the currency conversion process.

In addition to enhancing the global capabilities of the Mastercard Network, this rate class aids Mastercard in complying with these monetary policies.

- European Monetary Union (EMU) regulations requiring conversion of currencies transitioning to the euro at the fixed rate to the euro that is established by the EMU for the transition period.
- Other policies as defined from time to time by the monetary authorities in the countries where Mastercard does business and Mastercard has been informed of said policies.

The T057 production and T058 test bulk files contain the Currency Conversion Rate Detail Records; Mastercard-issued cross rates (Rate Class F) and Mastercard-issued USD rates (Rate Class M). For each Mastercard-issued rate, the reference currency is indicated in field 3 of the T057 file.

Mastercard communicates the availability of any new Mastercard-issued cross rates through a *Global Operations Bulletin*.

The Dual Message Clearing System selects the Mastercard-issued cross rates, class record (Rate Class F), only when the source and target currencies match the source and reference currency pair identified in the rate record.

All other currency conversions occur using the Mastercard-Issued USD Rates, class records (Rate Class M), for the source currency to the target currency. In cases where the target currency is not USD, the source currency is converted to USD and then to the target currency (for example, a computed cross rate).

For example, assume that the Dual Message Clearing System processes a transaction where the:

- Transaction currency is GBP

- Acquirer's reconciliation currency is USD
- Cardholder billing currency is EUR

Also assume that a Mastercard-issued cross rate has been established for the currency pair GBP: EUR and that EUR is the reference currency for this currency pair.

The Dual Message Clearing System calculates:

- USD acquirer's reconciliation amount using the GBP: USD Mastercard-Issued USD Rate.
- EUR cardholder billing amount using the GBP: EUR Mastercard-Issued Cross Rate.

Refer to examples further in this chapter for calculations.

### Application of currency conversion rates

The Dual Message Clearing System uses the currency conversion rates in effect at the time of authorization for eligible transactions requiring currency conversions.

Under certain circumstances, transactions are not eligible for use of the rates in effect at the time of authorization. This table provides an explanation of the special cases that can apply.

### Special cases

| Special Case                                 | Description                                                                                                                                                                                                                                                                                                                        | Impact                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Special Case 1: Delayed clearing submissions | <p>Transactions submitted for clearing for a Central Site Business Date more than 9 calendar days after the authorization (not including the original authorization day).</p> <p>For additional details on this scenario, see the next section <i>Additional information for special case 1: delayed clearing submissions</i>.</p> | <p>These transactions are not eligible for the rates effective at the time of authorization</p> <p>The Mastercard-issued rates as published in the Currency Conversion Rate File T057 for the current clearing processing day apply.</p> <p>PDS 0015, subfield 1 (Currency Conversion Date) = Date of Currency Conversion Rate File T057 for current clearing process day.</p> <p>PDS 0015, subfield 2 (Currency Conversion Indicator) = Value 2</p> |

| Special Case                                                  | Description                                                                                                                    | Impact                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Special Case 2: Multiple authorizations, one clearing message | Transaction contains multiple authorizations, for example, an initial authorization and subsequent incremental authorizations. | <p>If the clearing record was submitted within nine calendar days of the initial authorization, the Mastercard-issued rates as published in the Currency Conversion Rate File T057 used for the initial authorization apply.</p> <p>PDS 0015, subfield 1 (Currency Conversion Date) = Date of Currency Conversion Rate File T057 at the time of authorization.</p> <p>PDS 0015, subfield 2 (Currency Conversion Indicator) = Value 1</p> |

| Special Case                                                  | Description                                                                                                                                                                                                                | Impact                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|---------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Special Case 3: One authorization, multiple clearing messages | There are multiple clearing messages associated with a single authorization message. For example, a transaction for GBP 100 is authorized, but two messages are presented for clearing: one for GBP 80 and one for GBP 20. | <p>If any of the clearing messages were presented within nine calendar days of the authorization, the Dual Message Clearing System uses the currency conversion rates from the Currency Conversion Rate File T057 in effect at the time of the authorization.</p> <p>PDS 0015, subfield 1 (Currency Conversion Date) = Date of Currency Conversion Rate File T057 at the time of authorization.</p> <p>PDS 0015, subfield 2 (Currency Conversion Indicator) = Value 1.</p> <p>If a clearing record is submitted after the nine calendar day (U.S. Central date) period from authorization, the Mastercard-issued rates as published in Currency Conversion Rate File T057 on the day of clearing, apply for this clearing record.</p> <p>PDS 0015, subfield 1 (Currency Conversion Date) = Date of Currency Conversion Rate File T057 for current clearing process day.</p> <p>PDS 0015, subfield 2 (Currency Conversion Indicator) = Value 2.</p> |
| Special Case 4: Cleared, not authorized                       | Transaction was presented for clearing without authorization (that is, transaction was cleared but not authorized).                                                                                                        | <p>The Mastercard-issued rates as published in the Currency Conversion Rate File T057 on the day of clearing apply.</p> <p>PDS 0015, subfield 1 (Currency Conversion Date) = Date of Currency Conversion Rate File T057 for current clearing process day.</p> <p>PDS 0015, subfield 2 (Currency Conversion Indicator) = Value 2.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Special Case                                                              | Description                                                                                            | Impact                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Special Case 5: Partial authorizations                                    | The transaction was partially authorized.                                                              | <p>If any of the clearing messages were presented within nine calendar days of the authorization, the Dual Message Clearing System uses the currency conversion rates from the Currency Conversion Rate File T057 in effect at the time of the authorization.</p> <p>PDS 0015, subfield 1 (Currency Conversion Date) = Date of Currency Conversion Rate File T057 at the time of authorization.</p> <p>PDS 0015, subfield 2 (Currency Conversion Indicator) = Value 1 .</p> |
| Special Case 6: Specific MCCs, transaction types, and authorization types | Transactions classified under certain <a href="#">MCCs</a> , authorization types or transaction types. | <p>At this time, all MCCs, transaction types, and authorization types for first presentment transactions benefit from the rates effective at the time of authorization.</p> <p>Chargebacks and second presentments continue to use the rates applicable at the time of clearing.</p>                                                                                                                                                                                        |

| Special Case                                                                                                                                                                                           | Description                                                                                             | Impact                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Special Case 7: Transactions submitted for clearing for a Central Site Business Date within 9 calendar days (not including the original authorization day) but are unmatched to authorization records. | Clearing transactions submitted with an invalid trace ID and/or does not match an authorization record. | <p>These transactions are not eligible for the rates effective at the time of authorization, which require the matching of the clearing record to the authorization record to determine the applicable date of the currency conversion rate. Therefore, acquirers must submit all clearing records with identical trace IDs from the authorization record.</p> <p>PDS 0015, subfield 1 (Currency Conversion Date) = Date of Currency Conversion Rate File T057 for current clearing process day.</p> <p>PDS 0015, subfield 2 (Currency Conversion Indicator) = Value 2</p> |

#### Additional information for special case 1: delayed clearing submissions

Transactions presented for clearing within 9 calendar days (not including the original authorization day) and the Central Site Business Date will be eligible for the rate at the time of authorization. Refer to the chart for the eligibility window.

#### Transaction eligibility window

| Transactions authorized between 00:00 St Louis Time to 23:59 St. Louis Time | And submitted for clearing for the Central Site Business Date use the rate from the time of authorization |

| Tuesday                                                                     | Thursday (Authorization date+9)                                                                           |
| Wednesday                                                                   | Friday (Authorization date+9)                                                                             |
| Thursday                                                                    | Saturday (Authorization date+9)                                                                           |
| Friday                                                                      | Sunday (Authorization date+9)                                                                             |
| Saturday                                                                    | Monday (Authorization date+9)                                                                             |

### Example

Transaction A was authorized on Tuesday, 1 December at 23:00 St. Louis time.

Transaction B was authorized on Wednesday, 2 December at 01:00 St. Louis time.

Both Transaction A and B were submitted for the clearing Central Site Business Date of Friday, 11 December.

Transaction A will not be eligible for the rate at the time of authorization because the transaction was submitted more than 9 calendar days (not including the original authorization day) (that is, Tuesday, 1 December) and the Central Site Business Date (that is, Friday, 11 December). Therefore, the Mastercard-issued rates as published in the Currency Conversion Rate File T057 for the current clearing business day apply to Transaction A.

Transaction B uses the rate at the time of authorization because the transaction was submitted within 9 calendar days (not including the original authorization day) (that is, Wednesday, 2 December) and the Central Site Business Date (that is, Friday, 11 December).

## Data elements calculated during currency conversion process

The Dual Message Clearing System calculates a number of data elements for each transaction during the currency conversion process to calculate acquirer and issuer reconciliation amounts and cardholder billing amounts.

### Currency conversion for first presentments qualifying for regional settlement service

This section provides details and some examples related to the currency conversion approach used for transactions processed under a regional settlement service. To see a full list of the currencies that Mastercard offers for regional settlement, refer to the *Settlement Manual*.

### Acquirer side data elements

To calculate the acquirer settlement amount, the Dual Message Clearing System calculates and uses various [data elements \(DEs\)](#).

- Transaction Amount (DE 4): Each transaction is conducted in a currency agreed upon by a merchant and a cardholder. The value of the transaction in the transaction currency is referred to as the Transaction Amount.
- Total Acquirer Reconciliation Amount: The Transaction Amount is converted to acquirer reconciliation currency using the applicable rate associated with the transaction currency and the acquirer reconciliation currency. The Transaction Amount in acquirer reconciliation currency is referred to as the Total Acquirer Reconciliation Amount.

### Transaction Amount conversion flow

- Fixed Interchange Amount (PDS 0146): Fixed component of interchange fee applicable for a transaction is referred to as Fixed Interchange Amount in fixed interchange amount currency. This portion of the interchange fee does not change with the Transaction Amount. The Fixed Interchange Amount is converted from fixed interchange currency to acquirer reconciliation currency.

- Variable Interchange Amount (PDS 0146): Variable component of interchange fee applicable for a transaction is referred to as Variable Interchange Amount. This amount is calculated in transaction currency by multiplying the percentage Interchange Rate and the Transaction Amount. The calculated Variable Interchange Amount is then converted from transaction currency to acquirer reconciliation currency.

- Total Interchange Amount: Fixed Interchange Amount and Variable Interchange Amount in acquirer reconciliation currency are added to calculate Total Interchange Amount in acquirer reconciliation currency.
- Acquirer Net Reconciliation Amount: Total Interchange Amount is subtracted/added from Total Acquirer Reconciliation Amount to calculate Acquirer Net Reconciliation Amount in acquirer reconciliation currency.

**NOTE: Mastercard provides the T057 Currency Conversion Rate File, the Acquirer Currency Conversion Files (TQQ4: Regional First Presentments, TQQ8: Regional Second Presentments, and TQX2: Intracurrency Presentments), and the Clearing Detail File (IP755120-AA) to facilitate acquirer reconciliation. The Acquirer Currency Conversion Rate File provides the effective currency conversion rate of all possible [International Organization for Standardization \(ISO\)](#) currency codes between the transaction currency code and the acquirer reconciliation currency code and is available at the same time as the T057 file. The Clearing Detail File provides transaction-level details for the acquirer after each clearing cycle. Details regarding all the data elements provided in these files and how customers can register for them are provided at the end of this chapter.**

All the above-mentioned data elements are shown in the Clearing Detail File (IP755120-AA). See [Reports and files](#) for more information.

Timing of the applicable Mastercard-issued rates used in the clearing calculations aligns with the Mastercard-issued rates applied during the authorization of the transaction based on transaction eligibility as described in section "Application of Currency Conversion Rates."

The following example illustrates two methods that can be used in determining the applicable currency conversion rate.

**Example**

An acquirer submits two transactions to Mastercard Clearing for Dual Message Clearing System processing date 3 December 2024 which were authorized successfully on 1 December 2024 at 17:00 St. Louis time:

- Based on the nature of the transaction, Transaction A is eligible for use of the rates in effect at the time of authorization for clearing.
- Based on the nature of the transaction, Transaction B is not eligible to use the rates in effect at the time of authorization for clearing.

Acquirers can use the following methods to determine which effective date rates are applied for currency conversion during clearing processing.

**Acquirers that use the IP755120-AA Clearing Detail File**

For each transaction cleared, refer to PDS 0015 in each IP755120-AA record to determine the date of the rate file used by the Dual Message Clearing System during clearing processing and the reason why that date was used.

See [Reports and files](#) for more information.

**Example**

| Transaction   | PDS 0015, Subfield 1 | PDS 0015, Subfield 2                                                                                                                                                                                                                                   |
|---------------|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Transaction A | 201201               | Value 1<br>Matched with authorization information and authorization date rates applied for currency conversion.                                                                                                                                        |
| Transaction B | 201202               | Value 0<br>Not Applicable (for example, transaction not eligible/ applicable for currency conversion rate effective at the time of authorization) and Dual Message Clearing System Central site processing date rates applied for currency conversion. |

**Acquirers using an internal method instead of using the IP755120-AA Clearing Detail File**

For each transaction cleared, match with its corresponding authorization message. Acquirers should determine the most effective method for matching; one approach would be to use the

Banknet Reference Number found in the [Dual Message Authorization System](#) DE 63 (Network Data), subfield 2 (Banknet Reference Number).

If the transaction is eligible to use the rate in effect at the time of authorization, then use DE 16 (Date, Conversion) of the corresponding authorization message to determine which day's rate file to use for clearing message reconciliation.

If not, the rate files in effect on the clearing business processing date applies. The date in DE 16 is not used in this case.

### Example

| Transaction   | Value to Use                                 | Explanation                                                                                                                                                                                    |
|---------------|----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Transaction A | 201201 from DE 16                            | The currency conversion rates in effect on 1 December 2024 will be applicable in clearing (even though the clearing business processing date is 3 December 2024).                              |
| Transaction B | Clearing business processing date 3 Dec 2024 | Because the transaction is not eligible to use the rates in effect at the time of authorization, the currency conversion rates effective on the clearing business processing date are applied. |

The following examples show currency conversion calculations on the acquirer side of transactions with each using Mastercard-issued USD Rates and Mastercard-issued Cross Rates.

**NOTE: For simplicity, all examples are presented with rounding to the second decimal point. To see precise rounding conventions and calculations of the system, refer to the [Rounding of Dual Message Clearing System currency conversion](#).**

### Example 1: acquirers currency conversion examples for point-of-sale (POS) transactions, transaction and reconciliation currency are the same

The following example illustrates currency conversion calculations for a POS transaction where the transaction currency and acquirer reconciliation currency are the same. In this case, the transaction currency and acquirer reconciliation currency are the Canadian dollar (CAD). Other assumptions are listed as:

#### Assumptions

- Transaction Amount: CAD 50.00
- Acquirer Reconciliation Currency: CAD
- Fixed Interchange Amount: CAD 0.10
- Mastercard-issued USD Rate (USD-CAD): 1 USD = 1.25 CAD; Reference Currency: USD
- Interchange Rate = 1.00%

## Operation method using Clearing Detail File

The following table contains the transaction-level details through the Clearing Detail File.

| Data Element/Private Data Subelement | Value     |
|--------------------------------------|-----------|
| DE 4                                 | CAD 50.00 |
| DE 5                                 | CAD 50.00 |
| PDS 0146, subfield 7                 | CAD 0.60  |
| DE 9                                 | 1.0000    |

1. Obtain DE 4 and DE 9 from the Clearing Detail File.
2. Determine Total Acquirer Reconciliation Amount (DE 5) by multiplying DE 4 and DE 9.  
Total Acquirer Reconciliation Amount (DE 5) = Transaction Amount (DE 4) x Conversion Rate (DE 9)

$$\text{CAD } 50.00 \times 1.0000 = \text{CAD } 50.00$$

## Operational method using acquirer Currency Conversion Rate File

| Field 2 (Transaction Currency Code) | Field 3 (Acquirer Recon Currency Code) | Field 5 (Effective Currency Conversion Rate) |
|-------------------------------------|----------------------------------------|----------------------------------------------|
| CAD                                 | CAD                                    | 1.00                                         |

1. Locate the record in the Acquirer Currency Conversion Rate File where the Transaction Currency matches the currency in field 2 and the Acquirer Reconciliation Currency matches the currency in field 3 and extract the corresponding Conversion Rate in field 5.  
Conversion Rate (field 5) = 1.00
2. Determine the total acquirer reconciliation amount (DE 5) by multiplying the transaction amount (DE 4) by the conversion rate (field 5).  
Total Acquirer Reconciliation Amount (DE 5) = Transaction Amount (DE 4) x Conversion Rate (field 5)

$$\text{CAD } 50.00 \times 1.0000 = \text{CAD } 50.00$$

## Illustrative method with formulas

1. Total Acquirer Reconciliation Amount

**NOTE: Since transaction currency and acquirer reconciliation currency are the same, Total Acquirer Reconciliation Amount and Transaction Amount are equal.**

$$\text{Total Acquirer Reconciliation Amount} = \text{Transaction Amount} = \text{CAD } 50.00$$

2. Variable Interchange Amount

**NOTE: Since transaction currency and acquirer reconciliation currency are the same, Variable Interchange Amount in acquirer reconciliation currency is the same as the amount in transaction currency.**

Variable Interchange Amount in acquirer reconciliation currency = Variable Interchange Amount in transaction currency = Transaction Amount x Interchange Rate

CAD 50.00 x 1.00% = CAD 0.50

3. Fixed Interchange Amount

**NOTE: Since fixed interchange amount currency and acquirer reconciliation currency are the same, Fixed Interchange Amount in acquirer reconciliation currency is the same as the amount in fixed interchange amount currency.**

Fixed Interchange Amount in acquirer reconciliation currency = Fixed Interchange Amount in fixed interchange amount currency = CAD 0.10

4. Total Interchange Amount

Total Interchange Amount in acquirer reconciliation currency = Variable Interchange Amount in acquirer reconciliation currency + Fixed Interchange Amount in acquirer reconciliation currency

CAD 0.50 + CAD 0.10 = CAD 0.60

5. Acquirer Net Reconciliation Amount

Acquirer Net Reconciliation Amount = Total Acquirer Reconciliation Amount – Total Interchange Amount

CAD 50.00 – CAD 0.60 = CAD 49.40

**Example 2: acquirers POS transactions (Mastercard-issued rates), the transaction currency and the reconciliation currency are different, the transaction currency is the reference currency**

The following example illustrates currency conversion calculations for a POS card transaction where the transaction currency does not equal the acquirer reconciliation currency. In this case, the transaction currency is in British pounds (GBP), and the acquirer reconciliation currency is in Australian dollars (AUD).

The calculations in this example would apply for any transaction where a Mastercard-issued Rate (USD and Cross Rate) and the transaction amount are in the Reference Currency (in this case, GBP), and the reconciliation amount is not in the Reference Currency. This includes any transactions where the transaction amount is in U.S. dollars, and the reconciliation currency is something other than U.S. dollars, since the U.S. dollar is the Reference Currency for all Mastercard-issued USD Rates (Rate Class M currency pairs).

In such cases, Mastercard uses the currency conversion rate in field 7 of the T057 file (that is, the buy rate) to convert from transaction currency to reconciliation currency. In the example below, the GBP-AUD rate of 2.0000 AUD per 1 GBP represents the rate in field 7 of the Rate Class F table in the T057 file. This same rate will also be seen in the corresponding matching record in the Acquirer Currency Conversion Rate File delivered during the same period as the

T057 file and in DE 9 for the transaction as presented in the Clearing Detail File once the transaction is processed.

Other assumptions are listed as:

### Assumptions

- Transaction Amount: GBP 30.00
- Acquirer Reconciliation Currency: AUD
- Mastercard-issued Cross Rate (GBP-AUD): GBP 1 = AUD 2.0000; Reference Currency GBP
- Interchange Rate = 1.20%
- Fixed Interchange Amount = AUD 0.10

### Operation method using Clearing Detail File

The following table contains the transaction level details through the Clearing Detail File.

| Data Element/Private Data Subelement | Value     |
|--------------------------------------|-----------|
| DE 4                                 | GBP 30.00 |
| DE 5                                 | AUD 60.00 |
| PDS 0146, subfield 7                 | AUD 0.82  |
| DE 9                                 | 2.0000    |

1. Obtain DE 4 and DE 9 from the Clearing Detail File.
2. Determine Total Acquirer Reconciliation Amount (DE 5) by multiplying DE 4 and DE 9.

Total Acquirer Reconciliation Amount (DE 5) = Transaction Amount (DE 4) x Conversion Rate (DE 9)

GBP 30.00 x 2.0000 = AUD 60.00

### Operational method using acquirer Currency Conversion File

The following table contains the effective currency conversion rate in the Acquirer Currency Conversion Rate File

| Field 2 (Transaction Currency Code) | Field 3 (Acquirer Recon Currency Code) | Field 5 (Effective Currency Conversion Rate) |
|-------------------------------------|----------------------------------------|----------------------------------------------|
| GBP                                 | AUD                                    | 2.00                                         |

1. Locate the record in the Acquirer Currency Conversion Rate File where the Transaction Currency (GBP) matches the currency in field 2 and the Acquirer Reconciliation Currency (AUD) matches the currency in field 3 and extract the corresponding Conversion Rate in field 5.  
Conversion Rate (field 5) = 2.00

2. Determine Total Acquirer Reconciliation Amount (DE 5) by multiplying Transaction Amount (DE 4) by Conversion Rate (field 5)  
Total Acquirer Reconciliation Amount (DE 5) = Transaction Amount (DE 4) x Conversion Rate (field 5)

$$\text{GBP } 30.00 \times 2.0000 = \text{AUD } 60.00$$

#### Illustrative method with formulas

1. Total Acquirer Reconciliation Amount  
Total Acquirer Reconciliation Amount = Transaction Amount x Conversion Rate (GBP-AUD)

$$\text{GBP } 30.00 \times \text{GBP-AUD } 2.0000 = \text{AUD } 60.00$$

2. Variable Interchange Amount  
Variable Interchange Amount in transaction currency = Transaction Amount x Interchange Rate

$$\text{GBP } 30.00 \times 1.20\% = \text{GBP } 0.36$$

$$\text{Variable Interchange Amount in acquirer reconciliation currency} = \text{Variable Interchange Amount in transaction currency} \times \text{Conversion Rate (GBP-AUD)}$$

$$\text{GBP } 0.36 \times \text{GBP-AUD } 2.0000 = \text{AUD } 0.72$$

3. Fixed Interchange Amount

**NOTE: Since fixed interchange amount currency and acquirer reconciliation currency are the same, Fixed Interchange Amount in acquirer reconciliation currency is the same as the amount in fixed interchange amount currency.**

$$\text{Fixed Interchange Amount in acquirer reconciliation currency} = \text{Fixed Interchange Amount in fixed interchange amount currency} = \text{AUD } 0.10$$

4. Total Interchange Amount  
Total Interchange Amount in acquirer reconciliation currency = Variable Interchange Amount in acquirer reconciliation currency + Fixed Interchange Amount in acquirer reconciliation currency

$$\text{AUD } 0.72 + \text{AUD } 0.10 = \text{AUD } 0.82$$

5. Acquirer Net Reconciliation Amount  
Acquirer Net Reconciliation Amount = Total Acquirer Reconciliation Amount – Total Interchange Amount in acquirer reconciliation currency

$$\text{AUD } 60.00 - \text{AUD } 0.82 = \text{AUD } 59.18$$

#### **Example 3: acquirers POS transactions (Mastercard-issued rates), the transaction currency and the reconciliation currency are different, the reconciliation currency is the reference currency**

The example illustrates currency conversion calculations for a POS transaction where a Mastercard-issued Rate was applied and the transaction currency does not equal the acquirer reconciliation currency. In this case, the transaction currency is in Japanese yen (JPY), and the acquirer reconciliation currency is in U.S. dollars (USD).

The calculations in this example would apply for any transaction where the Reconciliation amount is in the Reference Currency (in this case, USD), and the Transaction Amount is not in the Reference Currency (in this case, JPY).

In such cases, in calculating the acquirer reconciliation amount on transactions for which Mastercard does offer a regional settlement currency, Mastercard uses the currency conversion rate in field 9 of the T057 file (that is, the sell rate) to convert from transaction currency to reconciliation currency. In the example below, the USD-JPY rate of 108.3300 JPY per 1 USD represents the rate in field 9 of the Rate Class M table in the T057 file.

Otherwise, in calculating the acquirer reconciliation amount on transactions for which Mastercard does not offer a regional settlement currency, Mastercard uses the currency conversion rate in field 8 of the T057 file (that is, the mid rate) to convert from transaction currency to reconciliation currency. In both cases, this same rate can also be seen in the corresponding matching record in the Acquirer Currency Conversion Rate File delivered during the same period as the T057 file and in DE 9 for the transaction as presented in the Clearing Detail File once the transaction is processed.

### Assumptions

- Transaction Amount: JPY 3,500
- Acquirer Reconciliation Currency: USD
- Mastercard-issued USD Rate: USD 1 = JPY 108.3300; Reference Currency USD
- Interchange Rate = 1.20%
- Fixed Interchange Amount = USD 0.15

### Operation Method Using Clearing Detail File

The following table contains the transaction level details through the Clearing Detail File.

| Data element/private data subelement | Value     |
|--------------------------------------|-----------|
| DE 4                                 | JPY 3,500 |
| DE 5                                 | USD 32.31 |
| PDS 0146, subfield 7                 | USD 0.54  |
| DE 9                                 | 0.009231  |

1. Obtain DE 4 and DE 9 from the Clearing Detail File.
2. Determine Total Acquirer Reconciliation Amount (DE 5) by multiplying DE 4 and DE 9.

Total Acquirer Reconciliation Amount (DE 5) = Transaction Amount (DE 4) x Conversion Rate (DE 9)

JPY 3,500 x 0.009231 = USD 32.31

## Operational method using acquirer currency conversion file

| Field 2 (Transaction Currency Code) | Field 3 (Acquirer Recon Currency Code) | Field 5 (Effective Currency Conversion Rate) |
|-------------------------------------|----------------------------------------|----------------------------------------------|
| JPY                                 | USD                                    | 0.009231                                     |

1. Locate the record in the Acquirer Currency Conversion Rate File where the Transaction Currency (JPY) matches the currency in field 2 and the Acquirer Reconciliation Currency (USD) matches the currency in field 3 and extract the corresponding Conversion Rate in field 5.  
Conversion Rate (field 5) = 0.009231
2. Determine Total Acquirer Reconciliation Amount (DE 5) by multiplying Transaction Amount (DE 4) by Conversion Rate (field 5)  
Total Acquirer Reconciliation Amount (DE 5) = Transaction Amount (DE 4) x Conversion Rate (field 5)  
 $JPY\ 3,500 \times 0.009231 = USD\ 32.31$

## Illustrative method with formulas

1. Total Acquirer Reconciliation Amount  
Total Acquirer Reconciliation Amount = Transaction Amount / Conversion Rate (USD-JPY)  
 $JPY\ 3,500 / USD-JPY\ 108.3300 = USD\ 32.31$
2. Variable Interchange Amount  
Variable Interchange Amount in transaction currency = Transaction Amount x Interchange Rate  
 $JPY\ 3,500 \times 1.20\% = JPY\ 42$   
Variable Interchange Amount in acquirer reconciliation currency = Variable Interchange Amount in transaction currency / Conversion Rate (USD-JPY)  
 $JPY\ 42 / USD-JPY\ 108.3300 = USD\ 0.39$
3. Fixed Interchange Amount

**NOTE: Since fixed interchange amount currency and acquirer reconciliation currency are the same, Fixed Interchange Amount in acquirer reconciliation currency is the same as the amount in fixed interchange amount currency.**

Fixed Interchange Amount in acquirer reconciliation currency = Fixed Interchange Amount in fixed interchange amount currency = USD 0.15

4. Total Interchange Amount  
Total Interchange Amount in acquirer reconciliation currency = Variable Interchange Amount in acquirer reconciliation currency + Fixed Interchange Amount in acquirer reconciliation currency  
 $USD\ 0.39 + USD\ 0.15 = USD\ 0.54$

5. Acquirer Net Reconciliation Amount

Acquirer Net Reconciliation Amount = Total Acquirer Reconciliation Amount – Total Interchange Amount in acquirer reconciliation currency

USD 32.31 – USD 0.54 = USD 31.77

## Other acquirer calculation considerations: computed cross rates and fixed interchange

For transactions where a Mastercard-issued rate is not applicable (that is, none of the currencies are U.S. dollar or the currency pair is not a Mastercard-issued cross rate), the Dual Message Clearing System performs currency conversion by going through the U.S. dollar and using two Mastercard-issued rates to calculate a cross rate (computed cross rate).

First, the system calculates a cross rate by dividing the currency conversion rate for the reconciliation currency as published in field 7 of the T057 file by the currency conversion rate for the transaction currency published in field 8. Then, this computed cross rate is used to multiply the transaction amount to obtain the reconciliation amount in the reconciliation currency. Similarly, the computed cross rate is used to convert the variable interchange from the transaction currency to the reconciliation currency. The computed cross rate is also provided in the Acquirer Currency Conversion Rate File. In addition, the Clearing Detail File provides the computed cross rate for each transaction in DE 9 and can be used for reconciliation.

Regarding fixed interchange, any time the fixed interchange currency is different from the acquirer reconciliation currency, the currency conversion process follows the same process as described in the examples above where the fixed interchange amount is converted as any other transaction amount.

## Issuer side data elements

To calculate the issuer reconciliation and cardholder billing amounts, the Dual Message Clearing System calculates various data elements.

- Transaction Amount (DE 4): Each transaction is conducted in a currency agreed upon by a merchant and a cardholder. The value of the transaction in the transaction currency is referred to as the Transaction Amount.
- Initial Cardholder Billing Amount: This amount is calculated by converting the Transaction Amount from transaction currency to cardholder billing currency.

- Currency Conversion Assessment (CCA): The Initial Cardholder Billing Amount is multiplied by the Currency Conversion Assessment Rate (CCA Rate) to calculate the Currency Conversion Assessment in cardholder billing currency. This amount is then converted to issuer reconciliation currency.

- Issuer Currency Conversion Amount: This amount is calculated in cardholder billing currency by multiplying Initial Cardholder Billing Amount and Issuer Currency Conversion Rate (ICCR or Cross Border Fee Manager Rate).
- Total Cardholder Billing Amount: This amount is calculated in cardholder billing currency by adding Initial Cardholder Billing Amount and Issuer Currency Conversion Amount.
- Initial Issuer Reconciliation Amount: This amount is calculated by converting the cardholder billing amount based on the default cardholder billing currency to the issuer reconciliation currency.

- Total Issuer Reconciliation Amount: This amount is calculated in issuer reconciliation currency by adding Initial Issuer Reconciliation Amount and Currency Conversion Assessment in issuer reconciliation currency.
- Fixed Interchange Amount (PDS 0146): The Fixed component of the interchange fee applicable for a transaction is referred to as Fixed Interchange Amount in fixed interchange amount currency. This portion of the interchange fee does not change with the Transaction Amount. The Fixed Interchange Amount is converted from fixed interchange currency to issuer reconciliation currency.

- Variable Interchange Amount (PDS 0146): The Variable component of the interchange fee applicable for a transaction is referred to as the Variable Interchange Amount. This amount is calculated in transaction currency by multiplying the percentage Interchange Rate and the Transaction Amount. The calculated Variable Interchange Amount is then converted from transaction currency to issuer reconciliation currency.

- Total Interchange Amount: Fixed Interchange Amount and Variable Interchange Amount in issuer reconciliation currency are added to calculate Total Interchange Amount in issuer reconciliation currency.
- Issuer Net Reconciliation Amount: Total Interchange Amount in issuer reconciliation currency is subtracted/added from Total Issuer Reconciliation Amount to calculate Issuer Net Reconciliation Amount in issuer reconciliation currency.

The above-mentioned data elements (DEs) are shown in the [IPM](#) File as:

### DE descriptions

| Description                                                                  | Data Element/Private Data Subelement                                                           | Notes                                                                                                                                   |
|------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| Transaction Amount                                                           | DE 4                                                                                           |                                                                                                                                         |

For issuers using the T112 Bulk File Type to reconcile, the applicable currency conversion rate and related DEs (for example, DE 9 [Conversion Rate, Reconciliation] and DE 10 [Conversion Rate, Cardholder Billing]) are included in this file.

Timing of the applicable Mastercard-issued rates used in the clearing calculations aligns with the Mastercard-issued rates applied during the authorization of the transaction based on transaction eligibility as described in the section titled "Application of Currency Conversion Rates."

For issuers that want to determine the date of the rate file used by the Dual Message Clearing System during clearing processing for each transaction, and the reason why that date was used, refer to PDS 0015. Below is an example of how PDS 0015 may be populated.

Example

An acquirer submits two transactions to Mastercard Clearing for Dual Message Clearing System processing date 3 December 2023, which were authorized successfully on 1 December 2023.

- Based on the nature of the transaction, Transaction A is eligible for use of the rates in effect at the time of authorization for clearing processing.
- Based on the nature of the transaction, Transaction B is not eligible for use of the rates in effect at the time of authorization for clearing processing.

Examples

| Transaction   | PDS 0015, subfield 1<br>(Currency Conversion Date) | PDS 0015, subfield 2 (Currency Conversion Indicator)                                                                                                                                                                                                          |
|---------------|----------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Transaction A | 201201                                             | Value 1<br>(Matched with authorization information and authorization date rates applied for currency conversion.)                                                                                                                                             |
| Transaction B | 201202                                             | Value 0<br>Not Applicable (for example, transaction not eligible/ applicable for currency conversion rate effective at the time of authorization) and <i>Dual Message Clearing System</i> Central site processing date rates applied for currency conversion. |

The following are examples that illustrate how interchange, CCA, and *Issuer Currency Conversion Rate (ICCR)* or Cross Border Fee Manager Rates are calculated throughout the transaction flow. For the specific currency conversion rates for any transaction scenario, issuers can use the transaction IPM message, in particular DE 9 and DE 10 as described above. The currency conversion rates in these data elements will be the same, or derived from, the rates in the T057 file, which are wholesale market rates.

**Example 4: issuers currency conversion examples for Point-of-Sale transactions, Mastercard-issued USD rates**

The following example illustrates currency conversion calculations for a POS transaction where the transaction currency does not equal the cardholder billing currency. In this case, the transaction currency is in Mexican pesos (MXN), and the cardholder billing currency is in U.S. dollars (USD). Other assumptions are listed as:

**Assumptions**

- Transaction Amount: MXN 180.00
- Cardholder Billing Currency Default: USD
- Issuer Reconciliation Currency: USD
- Mastercard-Issued USD Rate (USD-MXN): USD 1 = MXN 18.0000
- CCA Rate = 0.20%
- ICCR or Cross Border Fee Manager Rate = 0%
- Interchange Rate = 1.00%
- Fixed Interchange Amount = USD 0.10

The table contains the transaction level details through Mastercard's outbound IPM file.

| <b>Data Element/Private Data Subelement</b> | <b>Value</b> | <b>Notes</b>                                                                                                                            |
|---------------------------------------------|--------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| DE 4                                        | MXN 180.00   |                                                                                                                                         |
| DE 5                                        | USD 10.02    | Inclusive of CCA if applicable                                                                                                          |
| DE 6                                        | USD 10.00    | Inclusive of Issuer Currency Conversion Rate (ICCR) Amount or Cross Border Fee Manager Amount if applicable                             |
| DE 9                                        | 0.055667     | Effective conversion rate (inclusive of CCA if applicable)                                                                              |
| DE 10                                       | 0.055556     | Effective conversion rate (Inclusive of Issuer Currency Conversion Rate [ICCR] Amount or Cross Border Fee Manager Amount if applicable) |
| DE 111                                      | USD 0.02     |                                                                                                                                         |
| PDS 0146, subfield 7                        | USD 0.20     |                                                                                                                                         |

**Operational method**

1. Obtain DE 4, DE 9, and DE 10 from the outbound IPM file.
2. Determine Total Cardholder Billing Amount (DE 6) by multiplying DE 4 and DE 10.  
Total Cardholder Billing Amount (DE 6) = Transaction Amount (DE 4) x Conversion Rate (DE 10)

$\text{MXN } 180.00 \times 0.055556 = \text{USD } 10.00$  (Inclusive of Issuer Currency Conversion Rate [ICCR] Amount or Cross Border Fee Manager Amount if applicable)

3. Determine Total Issuer Reconciliation Amount (DE 5) by multiplying DE 4 and DE 9.  
Total Issuer Reconciliation Amount (DE 5) = Transaction Amount (DE 4) x Conversion Rate (DE 9)

$\text{MXN } 180.00 \times 0.055667 = \text{USD } 10.02006$ , rounded to USD 10.02 (inclusive of CCA if applicable)

### Illustrative method with formulas

1. Variable Interchange Amount  
Variable Interchange Amount in transaction currency = Transaction Amount x Interchange Rate

$\text{MXN } 180.00 \times 1.00\% = \text{MXN } 1.80$

Variable Interchange Amount in issuer reconciliation currency = Variable Interchange Amount in transaction currency / Conversion Rate (USD-MXN)

$\text{MXN } 1.80 / \text{USD-MXN } 18.0000 = \text{USD } 0.10$

2. Fixed Interchange Amount

**NOTE: Since fixed interchange amount currency and issuer reconciliation currency are the same, the Fixed Interchange Amount in issuer reconciliation currency is the same as the amount in fixed interchange amount currency.**

Fixed Interchange Amount in issuer reconciliation currency = Fixed Interchange Amount in fixed interchange amount currency = USD 0.10

3. Total Interchange Amount  
Total Interchange Amount = Variable Interchange Amount + Fixed Interchange Amount

$\text{USD } 0.10 + \text{USD } 0.10 = \text{USD } 0.20$

4. Initial Cardholder Billing Amount  
Initial Cardholder Billing Amount in cardholder billing currency = Transaction Amount / Conversion Rate (USD-MXN)

$\text{MXN } 180.00 / \text{USD-MXN } 18.0000 = \text{USD } 10.00$

5. Currency Conversion Assessment  
Currency Conversion Assessment in cardholder billing currency = Initial Cardholder Billing Amount x CCA Rate

$\text{USD } 10.00 \times 0.20\% = \text{USD } 0.02$

6. Issuer Currency Conversion Amount  
Issuer Currency Conversion Amount in cardholder billing currency = Initial Cardholder Billing Amount x ICCR or Cross Border Fee Manager Rate

$\text{USD } 10.00 \times 0.00\% = \text{USD } 0.00$

7. Total Cardholder Billing Amount

Total Cardholder Billing Amount in cardholder billing currency = Initial Cardholder Billing Amount + Issuer Currency Conversion Amount

USD 10.00 + USD 0.00 = USD 10.00

8. Initial Issuer Reconciliation Amount

**NOTE: Since cardholder billing currency and issuer reconciliation currency are the same, Initial Issuer Reconciliation Amount in issuer reconciliation currency is the same as Initial Cardholder Billing Amount in cardholder billing currency.**

Initial Issuer Reconciliation Amount in issuer reconciliation currency = Initial Cardholder Billing Amount in cardholder billing currency = USD 10.00

9. Currency Conversion Assessment in issuer reconciliation currency

**NOTE: Since cardholder billing currency and issuer reconciliation currency are the same, Currency Conversion Assessment in issuer reconciliation currency is the same as Currency Conversion Assessment in cardholder billing currency.**

Currency Conversion Assessment in issuer reconciliation currency = Currency Conversion Assessment in cardholder billing currency = USD 0.02

10. Total Issuer Reconciliation Amount

Total Issuer Reconciliation Amount = Initial Issuer Reconciliation Amount + Currency Conversion Assessment in issuer reconciliation currency

USD 10.00 + USD 0.02 = USD 10.02

11. Issuer Net Reconciliation Amount

Issuer Net Reconciliation Amount = Total Issuer Reconciliation Amount – Total Interchange Amount in issuer reconciliation currency

USD 10.02 – USD 0.20 = USD 9.82

#### **Example 5: issuers currency conversion examples, Point-of-Sale transactions, Mastercard-issued cross rates**

The following example illustrates currency conversion calculations for a POS transaction where the transaction currency does not equal the cardholder billing currency. In this case, the transaction currency is in Polish zloty (PLN), and the cardholder billing currency is in euros (EUR). Other assumptions are listed as:

##### **Assumptions**

- Transaction Amount: PLN 600.00
- Cardholder Billing Currency Default: EUR
- Issuer Reconciliation Currency: EUR
- Mastercard-Issued Cross Rate (EUR-PLN): EUR 1 = PLN 5.0000; Reference Currency is EUR
- ICCR or Cross Border Fee Manager Rate = 3.00%
- CCA Rate = 0.20%
- Interchange Rate = 1.20%
- Fixed Interchange Amount = EUR 0.10

The table contains the transaction level details through Mastercard's outbound IPM file.

| Data Element/Private Data Subelement | Value      | Notes                                                                                                                                   |
|--------------------------------------|------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| DE 4                                 | PLN 600.00 |                                                                                                                                         |
| DE 5                                 | EUR 120.24 | Inclusive of CCA if applicable                                                                                                          |
| DE 6                                 | EUR 123.60 | Inclusive of Issuer Currency Conversion Rate (ICCR) Amount or Cross Border Fee Manager Amount if applicable                             |
| DE 9                                 | 0.20040    | Effective conversion rate (inclusive of CCA if applicable)                                                                              |
| DE 10                                | 0.20600    | Effective conversion rate (Inclusive of Issuer Currency Conversion Rate [ICCR] Amount or Cross Border Fee Manager Amount if applicable) |
| DE 111                               | EUR 0.24   |                                                                                                                                         |
| PDS 0146, subfield 7                 | EUR 1.54   |                                                                                                                                         |

### Operational method

1. Obtain DE 4, DE 9, and DE 10 from the outbound IPM file.
2. Determine Total Cardholder Billing Amount (DE 6) by multiplying DE 4 and DE 10.  
Total Cardholder Billing Amount (DE 6) = Transaction Amount (DE 4) x Conversion Rate (DE 10)  
  
PLN 600.00 x 0.20600 = EUR 123.60 (Inclusive of Issuer Currency Conversion Rate [ICCR] Amount or Cross Border Fee Manager Amount if applicable)
3. Determine Total Issuer Reconciliation Amount (DE 5) by multiplying DE 4 and DE 9.  
Total Issuer Reconciliation Amount (DE 5) = Transaction Amount (DE 4) x Conversion Rate (DE 9)  
  
PLN 600.00 x 0.20040 = EUR 120.24 (inclusive of CCA if applicable)

### Illustrative method with formulas

1. Variable Interchange Amount  
Variable Interchange Amount in transaction currency = Transaction Amount x Interchange Rate  
  
PLN 600.00 x 1.20% = PLN 7.20  
  
Variable Interchange Amount in issuer reconciliation currency = Variable Interchange Amount in transaction currency / Conversion Rate (EUR-PLN)  
  
PLN 7.20 / EUR-PLN 5.0000 = EUR 1.44
2. Fixed Interchange Amount

**NOTE: Since fixed interchange amount currency and issuer reconciliation currency are the same, the Fixed Interchange Amount in issuer reconciliation currency is the same as the amount in fixed interchange amount currency.**

Fixed Interchange Amount in issuer reconciliation currency = Fixed Interchange Amount in fixed interchange amount currency = EUR 0.10

3. Total Interchange Amount

Total Interchange Amount = Variable Interchange Amount + Fixed Interchange Amount

EUR 1.44 + EUR 0.10 = EUR 1.54

4. Initial Cardholder Billing Amount

Initial Cardholder Billing Amount in cardholder billing currency = Transaction Amount / Conversion Rate (EUR-PLN)

PLN 600.00 / EUR-PLN 5.0000 = EUR 120.00

5. Currency Conversion Assessment

Currency Conversion Assessment in cardholder billing currency = Initial Cardholder Billing Amount x CCA Rate

EUR 120.00 x 0.20% = EUR 0.24

6. Issuer Currency Conversion Amount

Issuer Currency Conversion Amount in cardholder billing currency = Initial Cardholder Billing Amount x ICCR or Cross Border Fee Manager Rate

EUR 120.00 x 3.00% = EUR 3.60

7. Total Cardholder Billing Amount

Total Cardholder Billing Amount in cardholder billing currency = Initial Cardholder Billing Amount + Issuer Currency Conversion Amount

EUR 120.00 + EUR 3.60 = EUR 123.60

8. Initial Issuer Reconciliation Amount

**NOTE: Since cardholder billing currency and issuer reconciliation currency are the same, Initial Issuer Reconciliation Amount in issuer reconciliation currency is the same as Initial Cardholder Billing Amount in cardholder billing currency.**

Initial Issuer Reconciliation Amount in issuer reconciliation currency = Initial Cardholder Billing Amount in cardholder billing currency = EUR 120.00

9. Currency Conversion Assessment in Issuer Reconciliation Currency

**NOTE: Since cardholder billing currency and issuer reconciliation currency are the same, Currency Conversion Assessment in issuer reconciliation currency is the same as Currency Conversion Assessment in cardholder billing currency.**

Currency Conversion Assessment in issuer reconciliation currency = Currency Conversion Assessment in cardholder billing currency = EUR 0.24

10. Total Issuer Reconciliation Amount

Total Issuer Reconciliation Amount = Initial Issuer Reconciliation Amount + Currency Conversion Assessment in issuer reconciliation currency

EUR 120 + EUR 0.24 = EUR 120.24

11. Issuer Net Reconciliation Amount

Issuer Net Reconciliation Amount = Total Issuer Reconciliation Amount – Total Interchange Amount in issuer reconciliation currency

EUR 120.24 – EUR 1.54 = EUR 118.70

## Rounding of Dual Message Clearing System currency conversion

When the Dual Message Clearing System performs multiple currency conversion calculations before deriving a final amount, the Dual Message Clearing System performs the calculations on the interim amounts using the full six positions to the right of the decimal. The Dual Message Clearing System determines the final or target amount by rounding the amount to the currency exponent.

The [MPE](#) T067 (daily updates) and T068 (full file replacement), table IP0017T1: Currency Code and Exponents table provide customers with currency codes and associated currency exponents for each currency supported by Mastercard. The currency exponent indicates the number of significant digits to the right of the decimal point that are displayed when communicating amounts in the associated currency. This position (underlined in the examples that follow) is referred to as the minor currency unit position.

### Examples of currency exponent positioning

| Currency Description | Currency Code | Currency Exponent | Currency Amount |
|----------------------|---------------|-------------------|-----------------|
| Japanese Yen         | 392/JPN       | 0                 | 0               |
| U.S. Dollar          | 840/USD       | 2                 | 0.0 <u>0</u>    |
| Tunisian Dinar       | 788/TND       | 3                 | 0.00 <u>0</u>   |

- If the number in the low-order position is equal to or greater than 5, the number in the minor currency position is increased by a value of 1 to round the amount. For example, 17.559048 results in 17.56.
- If the number in the low-order position is less than 5, the low-order positions are truncated without rounding the amount. For example, 17.530011 results in 17.53.

The Dual Message Clearing System only rounds amounts to the number of positions to the right of the decimal point specified by the currency exponent once they are calculated in the final (issuer/acquirer reconciliation currency, cardholder billing currency) currency:

- After the Dual Message Clearing System calculates the currency conversion assessment in cardholder billing currency.
- After the Dual Message Clearing System completes the calculation of the total cardholder billing amount (Inclusive of [ICCR](#) Amount or Cross Border Fee Manager Amount if applicable).

- After the Dual Message Clearing System completes the calculation of acquirer and issuer reconciliation amounts in acquirer/issuer reconciliation currency.
- After the Dual Message Clearing System completes the calculation of an interchange fee in reconciliation currency.

## Customer currency conversion for chargebacks (all cycles)

Customers must meet specific requirements for submission of chargeback amounts (including currency conversion of chargeback amounts) depending on the phase of the chargeback life cycle.

### Customer requirements for submitting first chargeback amounts

These requirements apply to the amount that issuers may submit in first chargebacks.

- An issuer must not chargeback a transaction for an amount that exceeds the full amount of the transaction presented by the acquirer. The only exception is when the disputed amount must be converted to U.S. dollars, in which case, the chargeback may be for an amount greater than the transaction amount originally presented by the acquirer.
- An issuer may chargeback a transaction for less than the full amount of the transaction.
- The issuer should include the amount resulting from a currency conversion assessment (if applicable) in the chargeback amount that the issuer presents to Mastercard.
- Full chargebacks for ATM transactions (identified by a value of 01 in DE 3 (Processing Code), subfield 1 (Cardholder Transaction Type Code):
  - May include the processing fee (less the decline fee).
  - Should include the surcharge amount (access fee, direct charging fee, or convenience fee), when applicable in DE 54 (Amounts Additional), subfield 2 (Additional Amount, Amount Type), value 42. When DE 54 is in a chargeback message, the surcharge amount must be provided in the same currency of the chargeback message as indicated in DE 49 (Currency Code, Transaction).
  - Should not include switch fees.
- Partial chargebacks for ATM transactions should not include:
  - Transaction processing fees (including the decline fee)
  - Surcharge amounts (such as ATM access fees, direct charging fees, or convenience fees)
  - Switch fees

### Customer requirements and guidelines for charging back a partial amount

The rules and guidelines that customers charging back a transaction for less than its full amount must abide by are:

First Chargeback/1442 messages for an amount less than the full amount of the transaction contain DE 24 (Function Code), value 453. This identifies the first chargeback as a partial chargeback, which indicates that the first chargeback amount differs from the original transaction amount. Customers must identify subsequent second presentments and arbitration chargebacks as partial when the previous transaction was a partial first chargeback or a partial

second presentment. The customer must include the partial currency conversion assessment in the chargeback amount.

### **Customer requirements for charging back a purchase with a cash back transaction**

A purchase with cash back transaction is a transaction in which a purchase was conducted, and cash was dispensed by the acceptor at the point of interaction.

In the First Presentment/1240 messages, the total amount of the transaction (purchase plus cash) must be submitted in DE 4 (Amount, Transaction). The cash back portion of the transaction must be identified in DE 54 (Amounts, Additional), subfield 5 (Additional Amount, Amount) in the same currency as the transaction amount contained in DE 4.

Customers should follow the chargeback procedures for Purchase with Cash Back transactions described in Processing Chargeback Messages. To chargeback all or part of the purchase amount but not the cash back amount of a purchase with cash Back transaction, the customer must subtract the cash back portion from the cardholder billing amount. If the currency of the cash back portion differs from the currency of the cardholder billing amount, the customer must perform the following calculation:

- Remove any assessments or fees added to the cardholder billing amount.
- Use the process described in the Currency Conversion Calculations section to convert the cash back portion in DE 54 to the cardholder billing currency, applying the same exchange rates used by the Dual Message Clearing System.
- Subtract the converted DE 54 amount from the DE 4 amount of the First Presentment/1240 message to obtain the purchase amount.
- The revised DE 4 will now contain the purchase amount only.

When charging back all or a part of the purchase portion but not the cash back portion of a Purchase with Cash Back transaction, the customer must submit a First Chargeback/1442 message containing DE 24 (Function Code), value 453.

### **Currency conversion for customers in the U.S. region processing a chargeback message**

A U.S. issuer processing a chargeback message will not convert the message nor indicate any conversion therein but will process it in U.S. dollars through the First Chargeback/1442 message.

The chargeback amount submitted in DE 4 should not exceed the transaction amount previously provided to the issuer in DE 4 of the First Presentment/1240 message.

For partial chargebacks, the chargeback amount submitted in DE 4 of the chargeback message should be less than the transaction amount previously provided to the issuer in DE 4 of the first presentment. If an issuer submits multiple partial chargebacks for one first presentment, the total of the partial chargebacks must not exceed the transaction amount previously provided to the issuer in DE 4 of the first

## Currency conversion for customers outside the U.S. region processing a chargeback message

An issuer not in the U.S. region processing a chargeback message determine the currency of the chargeback amount as defined in the table.

### Chargeback processing currency determination process

| If...                                                                                                                                                                                                                                      | And...                                                                                                                                                                                                                                                | Then...                                                                                                                                                                                                                                                                                                                              |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| The issuer sending the chargeback and the acquirer receiving the chargeback participate in the same intracurrency settlement agreement and the transaction qualifies for the intracurrency agreement based on customer specified criteria. | <p>The disputed amount is in the intracurrency reconciliation currency.</p> <p>The disputed amount is not in the intracurrency reconciliation currency (for example, it is stated in the transaction currency or in the issuer billing currency).</p> | <p>The issuer processes the chargeback in the currency of the intracurrency settlement agreement.</p> <p>The issuer is required to pre-convert the disputed amount to U.S. dollars and then to the intracurrency reconciliation currency. The rate used for the pre-conversion should be the current or previous day's mid rate.</p> |
| The issuer sending the chargeback and the acquirer receiving the chargeback do not participate in the same intracurrency settlement agreement, or if the issuer is in region D and the transaction is not intra-Europe.                    | <p>The disputed amount is in U.S. dollars.</p> <p>The disputed amount is not in U.S. dollars (for example, it is stated in the transaction currency or in the issuer billing currency).</p>                                                           | <p>The issuer processes the chargeback in U.S. dollars.</p> <p>The issuer is required to pre-convert the disputed amount to U.S. dollars. The rate used for the pre-conversion should be the current or previous day's mid rate.</p>                                                                                                 |

For intra-European and inter-European transactions only, issuers may process a chargeback for the same or lesser amount of the original presentment received from the acquirer either:

- In the original presentment reconciliation currency, as specified in DE 5 (Amount, Reconciliation) of the First Presentment/1240 message.
- In the amount debited in the issuer's payment currency used for settlement of the original presentment, as specified in DE 6 (Amount, Cardholder Billing) of the First Presentment/1240 message.

For example, if the transaction is in EUR and the cardholder's currency is GBP, the chargeback amount may be in either EUR or GBP.

### Rates To Be used for pre-conversion in chargeback processing

Customers should use the following rates when pre-converting chargeback amounts.

**NOTE: Customers must use Mastercard-published rates when pre-converting chargeback amounts.**

### Pre-conversion chargeback rates

| Chargeback Submitted for Global Clearing Management System Processing Day | FX Rate File Received Calendar Day | Currency Update/1644 Messages Received in Clearing Transmission with Processing Day |
|---------------------------------------------------------------------------|------------------------------------|-------------------------------------------------------------------------------------|
| Monday                                                                    | Saturday                           | Saturday                                                                            |
| Tuesday                                                                   | Monday                             | Monday                                                                              |
| Wednesday                                                                 | Tuesday                            | Tuesday                                                                             |
| Thursday                                                                  | Wednesday                          | Wednesday                                                                           |
| Friday                                                                    | Thursday                           | Thursday                                                                            |
| Saturday                                                                  | Friday                             | Friday                                                                              |

### Pre-conversion calculation for a chargeback in intracurrency reconciliation currency

If the issuer sending a chargeback and the acquirer receiving the chargeback participate in the same intracurrency settlement agreement, and the transaction qualifies for the agreement according to customer specified criteria, and the disputed amount is in the reconciliation currency, no pre-conversion is required.

The issuer may process the chargeback using the amount in intracurrency reconciliation currency.

If the disputed amount is not in the intracurrency reconciliation currency, the issuer should use the intracurrency reconciliation amount (represented in DE 5 [Amount, Reconciliation]).

To calculate a chargeback in the intracurrency reconciliation currency, the issuer first converts the disputed amount to U.S. dollars by dividing it by the appropriate mid rate. The issuer then multiplies the resulting U.S. dollar amount by the mid rate associated with the intracurrency reconciliation currency.

### Pre-conversion calculation for a chargeback in U.S. dollars

To perform a pre-conversion calculation of a chargeback in U.S. dollars, the issuer divides the disputed amount by the mid rate associated with the disputed amount.

**NOTE: The chargeback amount presented by the issuer to Mastercard in U.S. dollars should include amounts resulting from a Currency Conversion Assessment, if applicable.**

## Acquirer processing of second presentments

An acquirer processes a second presentment for the same or lesser amount of the chargeback received from the issuer in U.S. dollars, without any further currency conversion.

For intra-European and inter-European transactions only, an acquirer may process a second presentment for the same or lesser amount of the chargeback received from the issuer either:

- In the currency of the chargeback, as specified in DE 4 (Amount Transaction) of the First Chargeback/1442 message.
- In the acquirer payment currency used for reconciliation of the chargeback, as specified in DE 5 (Amount, Reconciliation) of the First Chargeback/1442 message.

Acquirers cannot process a second presentment for an amount greater than the issuer's chargeback, but the acquirer may process a second presentment for a lesser amount.

Acquirers can initiate partial amount second presentments when an issuer has charged back the full amount of the original financial presentment and, through communication with the merchant, the acquirer is accepting responsibility for a portion of the disputed amount.

Acquirers notify Mastercard and issuers that the second presentment is for less than the full amount of the initial chargeback by providing value 282 in DE 24 (Function Code) of the Second Presentment/1240 message.

## Processing of pre-arbitration and arbitration case filings

A pre-arbitration or arbitration case filing should use the same currency as the currency used in the second presentment. If the currency of the second presentment is not supported, the amount should be converted to USD by utilizing the Mastercard published midrate from the day prior to the submission of the first chargeback.

See the Mastercom User Guide for a list of supported currencies.

A pre-arbitration or arbitration case filing may not be for an amount in excess of the acquirers second presentment, but it may be for a lesser amount.

## Currency conversion for settlement of fee collection messages

When the transaction currency is not equal to the sender or receiver reconciliation currency, the transaction amount is converted to the appropriate reconciliation currency.

Customers may find the currency conversion rate used in DE 9 (Conversion Rate, Settlement) of the Clearing Detail File if the customer is the message originator, or in DE 9 of the *IPM* file if the customer is the message receiver.

## Currency conversion for reversals

This section includes details about the currency conversion of reversal transactions, including how the conversion rate type is determined and the elements in which customers must provide the original *Dual Message Clearing System* processing date.

The currency conversion rate types (buy, mid, and sell) used for processing reversal transactions are determined using the same rules outlined earlier in this chapter for presentments, chargebacks, and fee collection messages.

*Acquirers* submitting first presentment reversal messages are required to provide the original Dual Message Clearing System processing date when submitting a first presentment reversal transaction in:

- PDS 0025 (Message Reversal Indicator), subfield 2 (Central Site Processing Date of Original Message) (if reversing an individual message)
- PDS 0026 (File Reversal Indicator), subfield 2 (Central Site Processing Date of Original File) (if reversing an entire file)

If the current Dual Message Clearing System processing date is within 7 processing days (excluding the original processing date) of the historical Dual Message Clearing System processing date, then the Dual Message Clearing System uses the historical currency conversion rate that was applied during the original clearing of the transactions.

If the current Dual Message Clearing System processing date is more than 7 processing days (excluding the original processing date) before the historical Dual Message Clearing System processing date, then the Dual Message Clearing System uses the currency conversion rates on the current processing day (for example, the currency conversion rates available at the reversal submission date, when processing the reversals).

For all reversals other than first presentments, the Dual Message Clearing System continues to use the current processing day's currency conversion rates.

For chargeback and fee collection reversals, the Dual Message Clearing System uses the current processing day's currency conversion rates when calculating the settlement value of the reversal.

## Currency Update/1644-640 Messages

The Currency Update/1644-640 messages provide Mastercard-issued USD Rates. These rates are published rates (as opposed to cross-rates).

Customers may request Currency Update/1644-640 messages from Mastercard as part of their inbound clearing files. This option is available at the processor level with the ability to specify the clearing cycle in which the processor should receive the messages.

**NOTE: The Dual Message Clearing System sends the Currency Update/1644-640 messages once per processor endpoint to the lowest (first) occurring Customer ID in the logical file. The Dual Message Clearing System does not provide a set of these messages for each Customer ID associated with the same processor. Only one set is provided in a delivery file. For example, if the customer elects to have clearing cycles 3 and 4 delivered as one file after the fourth clearing, only one set of rate messages is sent, not one each from 3 and 4.**

Delivery options for the Currency Update/1644-640 messages:

- Do not deliver Currency Update/1644-640 messages
- Deliver mid rate Currency Update/1644-640 messages
- Deliver buy and sell rate Currency Update/1644-640 messages only
- Deliver buy, sell, and mid rate Currency Update/1644-640 messages

The customer or processor receives the Currency Update/1644-640 messages in the delivery cycles for which the customer or processor has elected to receive the rates. The Dual Message Clearing System does not generate Currency Update/1644-640 messages for customers when there is no financial activity for that customer for a processing day.

## T057 Currency Conversion Rate File

The Currency Conversion Rate File provides customers with Mastercard-Issued USD Rates and Mastercard-Issued Cross Rates, in effect for a given processing day.

For more information and format details about the Currency Conversion Rate File, see the [Reports and files](#) section.

### Currency conversion rate effective day and time

The currency conversion rates used by the Dual Message Clearing System are guaranteed for each Dual Message Clearing System processing day for transactions not eligible for rates effective at the time of authorization. For transactions eligible for rates effective at time of authorization, refer to the Transaction Eligibility Window table in [Rates used for currency conversion](#).

### Effective day and time for currency conversion rates not qualified for FX rates at the time of authorization in **UTC** and Central Standard Time (CST)

| Rates Effective for Dual Message Clearing System Processing Day |        | Rates Effective for Calendar Day/ Time |           |        |           |
|-----------------------------------------------------------------|--------|----------------------------------------|-----------|--------|-----------|
| FX Rate File Received Calendar Day                              |        | From                                   |           | To     |           |
|                                                                 |        |                                        |           |        |           |

## Acquirer Currency Conversion Rate File

The Acquirer Currency Conversion Rate File provides the effective currency conversion rate of all possible [International Organization for Standardization \(ISO\)](#) currency codes between the transaction currency code and the acquirer reconciliation currency code.

The files are provided for the following presentments:

- Regional First Presentments (production bulk file TQQ4, test bulk file TQQ6)
- Regional Second Presentments (production bulk file TQQ8, test bulk file TQR0)
- Intracurrency Presentments (production bulk file TQX2, test bulk file TQX4)

For more information and format details about the Currency Conversion Rate File, see the [Reports and files](#) section.

**NOTE: The Acquirer Currency Conversion Rate File is applicable only to determine the acquirer reconciliation amount from the transaction currency. This file does not replace the existing T057 Currency Conversion Rate File. Customers continue to receive T057 rate files the same as before.**

### Acquirer Currency Conversion Rate effective day and time

The conversion rates in the Acquirer Currency Conversion Rate File follow the same effective times as the T057 Currency Conversion Rate File.

Customers interested in receiving the updated Acquirer Currency Conversion Rate File should contact the Global Customer Service team for additional information.

## Originating Institution Payment Transaction Currency Conversion Rate File

The Originating Institution Payment Transaction Currency Conversion Rate File gives customers the ability to determine the funding amount needed to reconcile with Mastercard specifically for cross-border payment transactions.

To assist customers in reconciling their payment transactions (DE 3 [Processing Code], subfield 1[Cardholder Transaction Type Code], value 28), this rate file contains all possible currency

conversion rates from the transaction currency to the Originating Institution's reconciliation currency code for regional First Presentment payment transactions.

**NOTE:** For more information and format details about the Currency Conversion Rate File, see the [Reports and files](#) section.

**NOTE:** The Originating Institution Payment Transaction Currency Conversion Rate File is applicable only for determining the Originating Institution's reconciliation amount to support cross-border payment transactions. This file does not replace the existing T057 Currency Conversion Rate File. Customers continue to receive T057 rate files.

Receiving institutions that reconcile must continue reconciling using currency conversion rate information provided in the First Presentment message and must not use the Originating Institution Payment Transaction Currency Conversion Rate File.

### Originating Institution Payment Transaction Currency Conversion Rate effective day and time

The Originating Institution Payment Transaction Currency Conversion Rate File conversion rates follow the same effective times as the T057 Currency Conversion Rate File conversion rates.

### Originating Institution Payment Transaction Currency Conversion Rate File format

Mastercard provides the Originating Institution Payment Transaction Currency Conversion Rate File for regional First Presentment Payment Transactions in production bulk file TS40, and test bulk file TS42.

## Clearing Detail File (IP755120-AA) to facilitate acquirer reconciliation

The Clearing Detail Report (IP755120-AA) provides transaction level details from the Dual Message System for the acquirer, including the currency conversion rate from the transaction amount to the acquirer reconciliation amount in DE 9 (Conversion Rate, Reconciliation). Mastercard uses bulk file TN70 (Production) and TN72 (Test) to deliver the IP755120-AA Clearing Detail File.

The report is generated and sent after each clearing cycle, including cycle seven.

To register for this file, acquirers must send an email to Global Customer Service at [customer\\_support@mastercard.com](mailto:customer_support@mastercard.com) designating which ICA(s) and endpoint(s) they would like to be set up for bulk file TN70/TN72 Clearing Detail Report IP755120-AA.

### Select data elements from the Clearing Detail File

| Data Element                  | Description                    |
|-------------------------------|--------------------------------|
| DE 5 (Amount, Reconciliation) | Acquirer Reconciliation Amount |

| Data Element                                                                                   | Description                                                                    |
|------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------|
| DE 9 (Conversion Rate, Reconciliation)                                                         | Currency Conversion Rate: Transaction Amount to Acquirer Reconciliation Amount |
| PDS 0146 (Amounts, Transaction Fee), subfield 7 (Amount, Fee, Reconciliation)                  | Total Interchange in Acquirer Reconciliation Currency                          |
| PDS 0015 (Clearing Currency Conversion Identifier), subfield 1 (Currency Conversion Date)      | Currency conversion date                                                       |
| PDS 0015 (Clearing Currency Conversion Identifier), subfield 2 (Currency Conversion Indicator) | Currency conversion indicator                                                  |

Refer to the [Reports and files](#) section for the layout of a Clearing Detail File.

## Duplicate Dual Message Clearing System files, postings, and potential duplicate rejects

A duplicate file occurs when the [Dual Message Clearing System](#) processes a file more than once. The Dual Message Clearing System has edits and built-in controls to detect and reject complete duplicate files or individual transactions when submitted by acquirers. A potential duplicate transaction reject occurs when the Dual Message Clearing System detects the transaction is a potential duplicate of a transaction that was previously processed.

### Dual Message Clearing System editing for duplicate files

To prevent a duplicate file from being processed, the Dual Message Clearing System rejects the entire file if PDS 0105 (File ID) in the File Header/1644 message matches one that was processed within the last 180 days for the customer or processor (specified in PDS 0105, subfield 3 [Processor ID]).

For example, suppose that customer 1234 sends file ID number 0022504150000000123400001. If the Dual Message Clearing System File ID History File contains the same file ID number within the last 180 days of file IDs from customer 1234, the Dual Message Clearing System rejects that second file 0022504150000000123400001 as a duplicate file.

### Reasons for duplicate Dual Message Clearing System files or postings

Duplicate postings may occur for various reasons, such as:

- An operator changes the file ID number on a previously processed file and resends it

- Previously processed merchant transactions are processed again, or
- The merchant submits the same transaction more than once

Mastercard recommends that customers establish controls to prevent and detect these and other errors to help prevent duplicate files and postings.

## Identification of duplicate Dual Message Clearing System postings

If a duplicate posting does occur, either the sending customer or the receiving customer may identify it.

If the receiving customer discovers a duplicate posting, it must notify the sending customer. The sending customer must inform the Mission Control and Operations Command Center by telephone and then take action to correct the duplicate postings by submitting reversals.

When the sending customer notifies Mastercard about a duplicate posting, the customer must provide for both the original and duplicated postings the following:

- File ID numbers
- Net amounts

## Potential duplicate clearing transaction rejections

The Dual Message Clearing System rejects 1240/200 First Presentment transactions if it is determined to be a potential duplicate of a previously processed transaction. A specific process must be followed to resubmit the transaction if the acquirer determines the transaction not to be a duplicate.

### Potential duplicate rejection

Mastercard has logic designed to identify potential duplicate First Presentment/1240/200 clearing messages by performing matching logic against the associated authorization message, and a comparison against other 1240/200 messages. There will be occasions where a false-positive is identified. When those instances occur, acquirers have the ability to resubmit the rejected clearing message.

Mastercard's goal is to reject as many potential duplicate clearing messages as possible, but issuers might still receive some duplicate clearing messages.

Acquirers receive 1644/691 rejection messages indicating the transaction rejected due to a potential duplication.

### Potential duplicate resubmission process

A rejected transaction that is verified to be a non-duplicate can be reprocessed by retaining and returning information from the reject message. PDS 0444: Resubmission Code will be included in the Message Exception/1644 message. PDS 0444 contains a resubmission code that must be included in any resubmitted First Presentment/1240 message that was previously identified as a potential duplicate. The presence of a valid value in PDS 0444 allows the resubmitted First Presentment/1240 message to bypass the potential duplicate detection and rejection process.

Mastercard accommodates the additional time taken to receive, research, and respond to rejected potential duplicate clearing transactions. Resubmitted First Presentment/1240 messages that contain a valid resubmission code are not subject to any interchange program timeliness requirements that may be required to qualify for some interchange programs.

As a reminder, Mastercard can identify up to 10 error codes, which are reasons for which a transaction is being rejected. Acquirers must ensure they are not only submitting PDS 0444 on the resubmission, but also that they are correcting any other identified reasons for which the transaction was rejected.

## Settlement service

This section defines the settlement service, various settlement service levels, and how the Dual Message Clearing System supports the settlement services.

### Definition of Settlement Service

Mastercard's settlement services provide the method by which Mastercard and customers transfer funds to complete settlement for clearing activities.

A settlement service is a facility within which funds are exchanged between customers and Mastercard to settle transaction and fee amounts. Each settlement service supports a reconciliation currency that Mastercard and its customers may exchange. Refer to the *Settlement Manual* for details about each settlement service.

Reconciliation currency is the currency in which a customer is paid or pays for the settlement of its activity. Reconciliation currency also is referred to as payment currency or settlement currency.

## Calculating net positions

This diagram shows how Mastercard settles transactions (in Central Time) among four customers: A, B, C, and D.

MasterCard receives incoming transaction data from each member between 08:00 and the end of the sixth clearing (08:00) the next day. In the below example, settlement occurs after 08:00 . MasterCard applies the interchange fees during each clearing to each applicable transaction. The boxes below show the net amount that each customer has submitted during processing.

After the Settlement Service cutoff MasterCard advises the global settlement bank of each member's net position and advises customers of their positions.

## Settlement service levels

Mastercard requires each customer to select the settlement service levels in which it wants to participate and to maintain a settlement account in the appropriate currency. The following explains settlement service functionality, which allows customers to customize settlement processing criteria for their transaction data.

The [Dual Message Clearing System](#) determines the settlement service, account, and associated currency for each payment party according to customer selected options.

Customers choose the settlement service levels and corresponding reconciliation currency that they want to support their specific settlement needs. Customers optionally may designate their participation in specific settlement services; however, all customers are required to participate in at least one regional settlement service. Clearing activity between two customers usually is settled at the lowest possible common settlement service level. If a customer pair does not settle in a common settlement service, the customers settle at their respective regional settlement service accounts. The defined regional default service for the customer is used if no other settlement service can be applied to the transaction.

The Dual Message Clearing System supports the settlement service levels listed in the following table.

### Supported settlement service levels

| Settlement Service Level | Description                                                                                                                                                                                                                                                                                           |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Bilateral                | Customers participating in a bilateral agreement instruct Mastercard to clear their transactions through the Dual Message Clearing System applying all appropriate business rules. The customers settle these transactions directly rather than through the Mastercard <a href="#">S.A.M.</a> system. |

| Settlement Service Level | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Intracurrency            | <p>Customers participating in an intracurrency settlement service adhere to a common settlement calendar, settlement cutoff, and reconciliation currency for their transactions. Mastercard settles these transactions for both parties on the same day. Interchange fees are calculated in the reconciliation currency, minimizing currency conversion impacts to the customers participating in the intracurrency settlement agreement.</p> <p>Customers that participate in intracountry interchange may settle transactions through intracurrency settlement services or regional settlement services. Transactions that qualify for intracountry interchange, but not intracurrency settlement service, are processed as regional settlement transactions; however, intracountry interchange still applies.</p> <p>A Customer ID may participate in multiple intracurrency settlement services. The participating customers must all agree on one reconciliation currency for each intracurrency service.</p> <p>Intracurrency settlement is an optional settlement service, and Mastercard must approve any agreements. However, based on some domestic transaction processing rules, Mastercard may require participating customers to enroll in the corresponding intracurrency settlement service.</p> |
| Regional                 | <p>A settlement agreement that allows customers to settle their activity in any regional settlement currency supported by Mastercard independent of the settlement currency of the other party to the transaction. This is the default agreement; that is, transactions settled by Mastercard that do not qualify for intracurrency settlement are automatically settled in a regional settlement service. Transactions that qualify for regional settlement are settled in U.S. dollars or a local currency approved by Mastercard, at a settlement bank defined by Mastercard.</p> <p>Each Customer ID must participate in at least one regional settlement service. If a customer participates in more than one regional settlement service, it must designate one regional settlement service as the default service, with no selection criteria. For the other regional settlement services, the customer must define specific settlement service selection criteria to indicate the circumstances in which the Dual Message Clearing System should select each of the other regional services.</p>                                                                                                                                                                                                        |

Base currency is the currency that Mastercard uses as the basis for settlement calculations. Most transaction currencies are converted against this currency when determining the customer reconciliation amount in the reconciliation currency. Summing these reconciliation amounts in base reconciliation currency will net to zero. For some transaction currencies, there is a direct cross rate to the customer reconciliation currency. These direct cross rates are represented in the standard T057 Rate File.

Customers may specify more than one account within each settlement service to segregate settlement activity according to criteria within the transaction, such as card program, account range, or [Bank Identification Number \(BIN\)](#). However, each account must be in the currency supported by the agreement.

**NOTE: The Global Settlement Services department must approve all settlement arrangements requested by a customer.**

## Settlement service selection process

The hierarchy for settlement service selection is bilateral, intracurrency, then regional.

The settlement service selection process evaluates customer participation in this order. If no intracurrency settlement service agreement exists in which both customers participate, Mastercard assigns each payment party's regional default settlement service and account information.

Transactions are qualified for a settlement service agreement that is in effect at the time that the Dual Message Clearing System processes the transaction. For financial exception items (chargebacks, second presentments, and fee collections) this may result in the assignment of a different settlement service from what was assigned at the time that the Dual Message Clearing System originally processed the transaction as a first presentment.

If, during the settlement service selection process, it is determined that the transaction qualifies for multiple settlement services within the same level, the Dual Message Clearing System uses the parameters with the most specific matching criteria; otherwise, the parameters with the most recent effective date and time are used.

To illustrate the settlement service selection process, assume that the following customers participate in settlement service agreements, with no additional criteria specified, as shown in the following table.

### Example customer participation

| Customer | Intracurrency | Regional |
|----------|---------------|----------|
| 001234   | X             | X        |
| 005678   | X             | X        |
| 009876   |               | X        |

Assume that customers 001234 and 005678 participate in the same intracurrency settlement agreement.

According to the information above, the following settlement services would be selected:

Transactions from 001234 to/from 005678⇒ Intracurrency settlement

Transactions from 005678 to/from 009876⇒ Regional settlement

Transactions from 009876 to/from 001234⇒ Regional settlement

## Settlement service selection

Customers may optionally use the following elements to specify how the [Dual Message Clearing System](#) should select the settlement service and associated account for their submitted clearing data.

- PDS 0158 (Business Activity), subfield 1 (Card Program Identifier)
- Account Range (DE 2 [Primary Account Number])
- DE 31 (Acquirer Reference Data), subfield 2 (Acquirer Reference ID)
- Issuing/Acquiring Activity (message type identifier [MTI] plus DE 24 [Function Code])

Settlement service selection criteria are communicated to Mastercard through the Net Settlement Information Form (Form 0339). These options may be applied for either of the Dual Message Clearing System supported settlement service levels: intracurrency and regional.

**NOTE: The Dual Message Clearing System does not perform settlement service selection for Global Collection Only transactions because these transactions are submitted for reporting purposes only.**

## Settlement service parameters

Customers may use optional parameters to specify how the Dual Message Clearing System should select the settlement account associated to the settlement service for their submitted clearing data.

### Optional parameters

| IPM Parameter           | Element                                                             | Usage                                                                                                                                                                                                      |
|-------------------------|---------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Card Program Identifier | PDS 0158 (Business Activity), subfield 1 (Card Program Identifier)  | If selected by the customer, this may be used for settlement service/TAA selection.                                                                                                                        |
| Account Range           | Derived from DE 2 (Primary Account Number [PAN])                    | If selected by the customer, this may be used for the settlement service/TAA selection.<br><br>This element identifies the account range associated with the cardholder account number of the transaction. |
| Acquiring BIN           | DE 31 (Acquirer Reference Data), subfield 2 (Acquirer Reference ID) | If selected by the customer, this may be used for settlement service/TAA selection.<br><br>This element identifies the acquiring BIN associated with the acquirer of the transaction.                      |

| IPM Parameter                   | Element                                               | Usage                                                                                                                                                                                                                                                                                                               |
|---------------------------------|-------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Issuing/Acquiring/Both Activity | Transaction Function (MTI plus DE 24 [Function Code]) | <p>If selected by the customer, this may be used for settlement service/TAA selection.</p> <p>The transaction function is used to classify a transaction as issuing and acquiring activity.</p> <p>Fee collection messages are considered an acquirer transaction for the sending ICA when this option is used.</p> |

**NOTE: The customer's transfer agent may be the customer or a separate entity that the customer authorizes to settle with Mastercard on its behalf.**

The following is an example of the settlement service selection process. Assume both customers participate in an intracurrency service using Canada Dollars (CAD) as the reconciliation currency. Customer ID 001234 is both an acquirer and an issuer. This customer has criteria established for the Intracurrency 1 settlement service. The customer chooses to settle only its issuing activity submitted with an assigned card program identifier of Mastercard Credit (*acceptor business code (MCC)*). Customer ID 005678 is an issuer only and has not specified criteria in order for transactions to qualify in this service.

The transaction is a First Presentment/1240 message and assigned a card program identifier of MCC. The transaction is sent by Customer ID 001234 and received by Customer ID 005678.

### Example settlement service selection process

| Customer                                      | Settlement Service  | CPI | Acct Rg | Acq BIN | Iss/Acq Act | TAA   | Txn Qualify |
|-----------------------------------------------|---------------------|-----|---------|---------|-------------|-------|-------------|
| 001234                                        | Intracurrency 1 CAD | MCC | —       | —       | Issuing     | 11111 | No          |
| 005678                                        |                     | —   | —       | —       | —           | 22222 | Yes         |
| Transaction meets criteria for each customer? |                     | ✓   | —       | —       | No          | —     | No          |

The Dual Message Clearing System determines the classification of acquiring activity or issuing activity based on the Customer ID (sending or receiving) within the message:

- Sending: DE 94 (Transaction Originator Institution ID Code)
- Receiving: DE 93 (Transaction Destination Institution ID)

In first presentments the sending customer is identified as the acquirer and the receiving customer is identified as the issuer.

In the example above, the transaction does not qualify for the service, because it did not meet the criteria of Customer ID 001234 that only its issuing activity should be settled within this service. Since Customer ID 001234 is sending the first presentment, it is acting in the capacity of an acquirer.

In first chargebacks, the sending customer is identified as the issuer and the receiving customer is identified as the acquirer.

In the example above, the transaction qualifies for the service, because it meets the customer's criteria that only its issuing activity should be settled within this service. Since Customer ID 001234 is sending the first chargeback, it is acting in the capacity of an issuer.

## Settlement service participation and criteria selection

Customers designate new or changed settlement account information using the Net Settlement Information Form (NSIF) (Form 0339). Customers may also select criteria by which Mastercard selects an appropriate settlement service and transfer agent assignment for their transactions.

These criteria are on the NSIF. Selection criteria for existing settlement services or accounts may be submitted using the NSIF. The NSIF is in the *Settlement Manual*.

The bilateral and intracurrency settlement agreement information is distributed to customers through the [IPM MPE](#). Customers can use this information as the selection criteria in their own settlement service selection process. For example, by using the selection criteria, customers determine when they can submit chargeback transactions in their local currency as opposed to U.S. dollars.

## Intracurrency settlement service selection

The Dual Message Clearing System verifies the possible intracurrency settlement services in which both the sending and receiving customers participate. All criteria associated with each customer's participation are also used in the selection process.

The following information is applicable for customers participating in an intracurrency settlement service agreement. Customers who do not participate in an intracurrency settlement service agreement may disregard this section.

### Step 1: settlement service selection

The Dual Message Clearing System compares the possible intracurrency settlement services in which both the sender and receiver participate to determine whether there are any common intracurrency settlement service agreements, as follows:

- If the customer pair has only one common intracurrency settlement service agreement, that service is selected and used in the subsequent validation process.
- If the customer pair has multiple common intracurrency settlement service agreements, the common settlement service agreement with the most specific matching criteria is selected. Otherwise, the common settlement service agreement with the most recent effective date is selected and used in the subsequent validation process.

### Example 1

Customer 001234 and customer 005678 both participate in intracurrency settlement agreements with the specified criteria in the following table.

#### Example where customers participate in intracurrency settlement agreements

| Customer | Settlement Service ID | CPI           | Acct Rg       | Acq BIN       | Iss/Acq Act   | Effective Date |
|----------|-----------------------|---------------|---------------|---------------|---------------|----------------|
| 001234   | Intracurrency 1       | Not Specified | Not Specified | Not Specified | Not Specified | 1 Dec 2023     |
|          | Intracurrency 2       | MCC           | Not Specified | Not Specified | Not Specified | 15 May 2024    |
| 005678   | Intracurrency 1       | Not Specified | Not Specified | Not Specified | Not Specified | 1 Dec 2023     |
|          | Intracurrency 2       | MCC           | Not Specified | Not Specified | Not Specified | 15 May 2024    |
| 009012   | Intracurrency 3       | Not Specified | Not Specified | Not Specified | Not Specified | 1 Dec 2023     |

Transactions submitted between customer 001234 and customer 005678 with an assigned card program identifier of MCC and processed on or after May 15th 2024, will be qualified for the intracurrency 2 settlement agreement. These transactions could be qualified for either the intracurrency 1 or the intracurrency 2 settlement service agreement. However, the intracurrency 2 agreement specifying all transactions with an assigned card program identifier of MCC contains more specific criteria, and is thus the selected settlement service agreement.

Transactions submitted between customer 001234 and customer 005678 with an assigned card program identifier other than MCC will be qualified for the intracurrency 1 settlement agreement.

Transactions submitted between customer 001234 and customer 009012 do not have an intracurrency settlement agreement in common and, therefore, would use the regional settlement service selection.

### Example 2

Customer 001234 and customer 005678 both participate in intracurrency settlement agreements with the specified criteria in the following table.

| Customer | Settlement Service ID | CPI           | Acct Rg       | Acq BIN       | Iss/Acq Act   | Effective Date |
|----------|-----------------------|---------------|---------------|---------------|---------------|----------------|
| 001234   | Intracurrency 1       | Not Specified | Not Specified | Not Specified | Not Specified | 1 Dec 2023     |
|          | Intracurrency 2       | Not Specified | Not Specified | Not Specified | Not Specified | 15 May 2024    |
| 005678   | Intracurrency 1       | Not Specified | Not Specified | Not Specified | Not Specified | 1 Dec 2023     |
|          | Intracurrency 2       | Not Specified | Not Specified | Not Specified | Not Specified | 15 May 2024    |

Transactions submitted between customer 001234 and customer 005678 on or after 15 May 2024 could be qualified for either the intracurrency 1 or the intracurrency 2 settlement agreement. There are no criteria for either service to help the system decide. Therefore, the selection process uses the most recent effective date and qualify transactions between these customers in the intracurrency 2 service.

The above example (example 2) is included to explain Dual Message Clearing System functionality. In reality, customers would add specific criteria to one of these settlement service selection setups, or delete one, instead of defining two settlement services with no selection criteria.

## Step 2: settlement service and Transfer Agent Assignment (TAA) selection

For each payment party (the sender and the receiver), identify all TAAs that meet each customer's criteria specified within the common settlement services identified in step 1.

### Step 2a: settlement service and issuer TAA selection

Settlement service is assigned according to one of the following:

- If there is only one intracurrency settlement service in common and only one TAA for each payment party that matches the transaction data, the Dual Message Clearing System assigns that settlement service and TAA combination to the transaction for each payment party.
- If there are multiple settlement services and/or TAA combinations with customized assignment criteria that match the transaction data, the issuing customer's assignment that has the most specific criteria matching the transaction is used to determine the service and the issuing customer TAA.
- If there are multiple TAA assignments for the issuing customer that match the transaction data, the assignment with the most recent effective date is used.

## Step 2b: acquirer TAA selection

Once the settlement service and TAA are assigned for the issuing customer, the acquiring customer's TAA is selected from those identified within the selected settlement service that match the transaction criteria:

- If there is only one TAA for the acquirer within the selected settlement service, that assignment is used for the acquirer's settlement.
- If there are multiple TAA combinations with customized assignment criteria that match the transaction data, the assignment that has the most specific criteria matching the transaction is used to determine the acquiring customer's TAA.
- If there are multiple TAA assignments for the acquiring customer that match the transaction data, the assignment with the most recent effective date is used.

### Example

To illustrate the TAA selection process, assume that both customers participate in the intracurrency 1 service and that customer 001234 is the issuing customer with the specified criteria shown in the following table.

#### Example illustrating the TAA selection process

| Settlement Service ID | Customer | TAA Acct and Cur | CPI           | Acct Rg       | Acq BIN       | Iss/ Acq Act  | Effective Date |
|-----------------------|----------|------------------|---------------|---------------|---------------|---------------|----------------|
| Intracurrency 1       | 001234   | XXXX, HKD        | DMC           | Not Specified | Not Specified | Not Specified | 1 Dec 2024     |
| Intracurrency 2       | 001234   | YYYY, HKD        | MCC           | Not Specified | Not Specified | Not Specified | 1 Jan 2024     |
| Intracurrency 2       | 001234   | ZZZZ, HKD        | MCC, MSI      | Not Specified | Not Specified | Not Specified | 1 Feb 2024     |
| Intracurrency 1       | 005678   | AAAA, HKD        | MCC, MSI      | Not Specified | Not Specified | Not Specified | 1 Mar 2024     |
| Intracurrency 2       | 005678   | BBBB, HKD        | MCC           | Not Specified | Not Specified | Not Specified | 1 Jan 2024     |
| Intracurrency 2       | 005678   | CCCC, HKD        | Not Specified | Not Specified | Not Specified | Not Specified | 1 Feb 2024     |

Transactions submitted with a transaction currency of HKD that are assigned a card program identifier of MCC are assigned the settlement service ID intracurrency 2 for both customers, and TAA of ZZZ for customer 001234 because it is the assignment with the most recent effective date. Because the transaction meets both of the acquirer's TAA criteria for the intracurrency 2

agreement, the TAA of BBBB would be chosen because it has the acquirer's most specific criteria that match the transaction.

### Step 3: transaction amount and fee calculation

The transaction amount is converted to the intracurrency account currency (reconciliation currency), if necessary. Additionally, the interchange fees are calculated in the intracurrency account currency (reconciliation currency).

## Regional settlement service selection

Regional settlement services are qualified independently and do not require both the sender and receiver to participate in the same regional level settlement service. If the transaction does not qualify for intracurrency settlement, it is qualified for settlement at the regional level.

The regional settlement service level specific features include:

- Each regional service specifies a settlement calendar,
- Each regional service specifies settlement cutoff time(s),
- Each regional service specifies a settlement date interval, and
- Each regional service specifies a settlement value date interval.

### Step 1: settlement service and TAA selection

The settlement service selection process described in the previous section does not apply to transactions processed at the regional settlement service level. Regional level services are qualified independently for the sender and receiver against the customer's specified criteria, as follows:

- If only one regional settlement service and [transfer agent assignment \(TAA\)](#) combination is established for a payment party that matches the transaction data, the [Dual Message Clearing System](#) assigns that TAA and account currency to the transaction.
- If multiple settlement services and/or TAAs are established with customized assignment criteria for a payment party that matches the transaction data, the Dual Message Clearing System assigns the settlement service and TAA combination with the most specific criteria. If more than one settlement service and TAA combination have the same level of specificity, the TAA with the most recent effective date is selected.
- The default settlement service and TAA are selected when no selection criteria are defined that match the transaction.

### Example 1

To illustrate the service selection process, assume that a customer participates in settlement service agreements with the specified selection criteria shown in the following table.

### Example illustrating the service selection process

| Customer | Settlement Service ID | TAA Acct and Cur | CPI           | Acct Rg       | Acq BIN       | Iss/Acq Act   |
|----------|-----------------------|------------------|---------------|---------------|---------------|---------------|
| 001234   | Regional 1            | XXXX, USD        | Not Specified | Not Specified | Not Specified | Not Specified |
| 001234   | Regional 2            | YYYY, CAD        | MCC           | Not Specified | Not Specified | Not Specified |

Transactions submitted with an assigned card program identifier of MCC are assigned the settlement service ID regional 2 and account YYYY because it has the most specific criteria that match the transaction. Transactions submitted with an assigned card program identifier other than MCC would be assigned to the settlement service ID regional 1 and account XXXX.

### Example 2

To illustrate the settlement service TAA account selection process, assume that a customer participates in the regional settlement service agreements as specified in the following table.

### Example illustrating the settlement service TAA account selection process

| Customer | Settlement Service ID | TAA Acct and Cur | CPI           | Acct Rg       | Acq BIN       | Iss/Acq Act   | Effective Date |
|----------|-----------------------|------------------|---------------|---------------|---------------|---------------|----------------|
| 005678   | Regional 1            | VVVV, USD        | MCC           | Not Specified | Not Specified | Issuing       | 1 Jan 2024     |
|          | Regional 1            | XXXX, USD        | DMC           | Not Specified | Not Specified | Issuing       | 15 Jan 2024    |
|          | Regional 2            | YYYY, CAD        | Not Specified | Not Specified | Not Specified | Acquiring     | 1 Jan 2024     |
|          | Regional 2            | ZZZZ, CAD        | Not Specified | Not Specified | Not Specified | Acquiring     | 15 Jan 2024    |
|          | Regional 3            | AAAA, USD        | Not Specified | Not Specified | Not Specified | Not Specified | 1 Jan 2024     |

The optional settlement service selection criteria defined above can have multiple occurrences per customer and are used to determine or restrict settlement account selection. Each unique grouping represents the criteria used to select a specific Customer ID, TA, and TAA combination. The more specific the criteria defined by the customer, the more combinations of Customer ID, TA, and TAA exist.

Customer 005678 is an issuer or acquirer. In this example, all issuing transactions with a card program identifier of MCC or DMC and a transaction currency of USD is settled in USD through the Regional 1 service. However, transactions with a card program identifier of MCC are settled using VVVV and transactions with DMC are settled using account XXXX. All acquiring transactions are settled in CAD through the Regional 2 service in account YYYY before 15 Jan 2024 and are settled in account ZZZZ on or after 15 Jan 2024. All other issuing transactions settle in USD through the Regional 3 Service in account AAAA.

## Step 2: transaction amount and fee calculation

The transaction amount is converted through U.S. dollars to the TAA account currency (reconciliation currency). Interchange fees are calculated in U.S. dollars and converted to each TAA account currency.

## Settlement date cycle calculation

Once the appropriate settlement service has been identified for each payment party, the settlement date is assigned.

The settlement date is the date on which the [S.A.M.](#) system determines the customers' final net settlement positions and generates the settlement advisements for customers and transfer agents.

A single transaction may qualify for a different regional settlement service for each payment party, which may result in the use of a different settlement date for each customer. Transactions qualifying for the same intracurrency agreements always result in the same settlement date for each customer. The settlement date rules include the following:

- If the settlement bank is closed, [Dual Message Clearing System](#) does not assign that date as a settlement date. For regional services, the U.S. settlement holidays are used.
- Settlement holiday dates are expressed in relation to Central Site time, from a St. Louis, Missouri, USA perspective.
- Certain settlement agreements may optionally delay their settlement. Two methods are used to delay settlement:
  - Generate the settlement advisements a specific number of days after the transactions have been processed. The delayed settlement advisements result in delayed funds movement.
  - Generate the settlement advisements as scheduled, but delay the funds movement by a specific number of days after the advisement.

## Fee calculation routines for settlement service levels

The Dual Message Clearing System uses the settlement service level to determine the currency in which to calculate fees. The following table describes how the Dual Message Clearing System calculates fees for each settlement service level.

### Settlement service level fee calculations

| Settlement Service Level | Fee Calculation Method                                                                                                                                                                                                                                                                                                                    |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Intracurrency            | <ul style="list-style-type: none"><li>Transaction amounts and fixed fees are converted to the reconciliation currency (if necessary).</li><li>Fees are calculated in the reconciliation currency.</li><li>Fees are converted to U.S. dollars for reporting purposes.</li></ul>                                                            |
| Regional                 | <ul style="list-style-type: none"><li>Transaction amounts and fixed fees are converted to U.S. dollars (if necessary).</li><li>Fees are calculated in U.S. dollars.</li><li>Transaction amounts and calculated fees are converted to each customer's reconciliation currency and remain in U.S. dollars for reporting purposes.</li></ul> |

## System-provided data in PDS 0159 (Settlement Data)

The Dual Message Clearing System creates PDS 0159 (Settlement Data) in IPM-format messages sent to the receiving customer to provide reconciliation and settlement information for each clearing transaction that has settlement impact. This element contains nine subfields.

Refer to [PDS 0159 \(Settlement Data\)](#) for the data populated in each subfield.

## Settlement service advisements

Mastercard offers settlement reporting to the customer, the transfer agent, or both. The customer advisement provides a settlement report for each settlement date and settlement service. The transfer agent advisement provides a settlement report for each settlement date and settlement service and itemizes settlement positions by customer.

A unique settlement advisement is generated for each transfer agent assignment (TAA) within a settlement service. If a customer has the same settlement account designated for multiple intracurrency and regional settlement services, a unique settlement advisement is generated for each settlement service.

## Customer settlement advisements

Customers optionally receive settlement advisements for all settlement positions for clearing activity resulting from one settlement service date and cutoff cycle.

Customer settlement advisements serve as notification to a customer of outstanding settlement positions resulting from a settlement service cutoff. This either provides the customer a method to ensure that appropriate funds are in place to effect settlement or notifies the customer about funds that will be available.

**NOTE: For more information about settlement advisements and the Net Settlement Information Form (NSIF), refer to the *Settlement Manual*.**

## Reversals

This section describes how to create reversals and how the [Dual Message Clearing System](#) processes them.

### How to create reversals

A reversal message informs the receiver to disregard the original message.

Reversal messages may not be received within the same clearing cycle as the original message. Therefore, the netting of the settlement between the two actions may not occur in the same cycle and perhaps not the same processing day.

The settlement values for a reversal message and its original together produce a net settlement value of zero.

Customers can reverse one or more individual messages or an entire clearing file.

### Identification of reversal messages

Customers must identify a single reversal message by adding private data subelement (PDS) 0025 (Message Reversal Indicator) to the message and populating its subfields correctly.

PDS 0025 subfield 1 must contain a value of R and subfield 2 must contain the original Dual Message Clearing System processing date of the message being reversed.

### Identification of reversal files

Customers have two options for identifying a reversal file.

- Add PDS 0026 (File Reversal Indicator) to the File Header message of the file, and populate subfield 1 (File Reversal Indicator) with a value of R. In subfield 2 (Central Site Processing

Date of Original File), provide the original *Dual Message Clearing System* processing date of the file being reversed.

- Add PDS 0025 (Message Reversal Indicator) to every message in the file except for the File Header and File Trailer messages. Subfield 1 (Message Reversal Indicator) must contain a value of R. Subfield 2 (Central Site Processing Date of Original Message) must contain the original Dual Message Clearing System processing date of the message being reversed.

## How to send individual reversal messages

Customers should follow this procedure to reverse an individual message.

### Procedure

1. The customer realizes that it needs to reverse an individual message.
2. The customer extracts the message to be reversed. For example, if a customer wants to reverse a message containing a specific cardholder account number, the customer can use the Message Selection Criteria utility to select and extract the message containing that cardholder account number.
3. The customer adds PDS 0025 (Message Reversal Indicator) to the message, with the value R in subfield 1 (Message Reversal Indicator) and the original Dual Message Clearing System processing date in subfield 2.
4. The customer adds the reversal message to one of its outgoing clearing files.
5. If the customer's original message needs to be resent because it contained incorrect data, the customer corrects the data in the original message and resubmits it.

The Dual Message Clearing System recognizes and processes individual reversal messages submitted in a file. There is no requirement to isolate reversal messages or to send them in separate files.

## How to send reversal files: full files

The *Dual Message Clearing System* allows customers to send one original file and one reversal file using the same file ID. This allows customers to correct invalid files with minimal changes to the original file. Customers should follow the procedure to reverse full files.

### Procedure

1. The customer realizes that it needs to reverse an entire file.
2. The customer sends a full file reversal using the same file ID or a new file ID. The customer adds PDS 0026 (File Reversal Indicator) to the file header message with the value R in subfield 1 (File Reversal Indicator) and the original Dual Message Clearing System processing date in subfield 2 (Central Site Processing Date of Original File).

Because PDS 0026 is present in the File Header message, the Dual Message Clearing System recognizes the file as a full file reversal. The Dual Message Clearing System inserts PDS 0025 (Message Reversal Indicator) into each individual message in the file and processes and distributes each message as a single-item reversal.

3. If the customer's original file needs to be resent because it contained incorrect data, the customer corrects the data in the original file and resubmits it using a different file ID.

Allowing customers to reverse files using the same file ID simplifies the creation of reversal files. Customers only need to populate PDS 0026 in the File Header message with an R to indicate that the entire file is being reversed.

**NOTE: Customers do not receive an entire file that is a full file reversal file (that is, PDS 0026 will not be present in the customer inbound file header). In the receiving customer's clearing file, reversal messages are mixed with non-reversal messages.**

## How to send reversal files: partial files

To send a partial reversal file, follow the steps outlined in this section.

### Procedure

1. Extract the messages to be reversed into a new file. For example, if a customer wants to reverse all of the first chargebacks from a file, the customer can extract all first chargebacks from the original file.
2. Create a file header message with a value of R in PDS 0026 (File Reversal Indicator).
3. Create a file trailer containing zeros in PDS 0301 (File Amount, Checksum) and PDS 0306 (File Message Counts).
4. Submit the file for processing.

**ATTENTION: Customers must not combine messages from more than one processing date to be reversed because the date in subfield 2 (Central Site Processing Date of Original File) of PDS 0026 will allow specification of only one original processing date for the currency conversion rate history. The [Dual Message Clearing System](#) uses that date's currency conversion rate (if necessary) to apply to the reversal transactions.**

Customers submitting a full or partial reversal file (indicated by the presence of PDS 0026 in the File Header) are not required to use a File ID that has already been processed. For example, customers creating a partial reversal file may choose to assign a new File ID instead of using the original File ID.

If multiple partial reversals are required before clearing a transaction, each reversal should always reference the original transaction data. For example, within DE 48 (Additional Data: Private Use), subelement 63 (Trace ID), DE 90 (Original Data Elements) and DE 4 (Amount, Transaction) of the Reversal Request/0400 message, the amount value should be the authorized amount from the original transaction to support issuer matching (do not use the adjusted amount from DE 95 (Replacement Amounts) within a previous reversal, or the requested amount if a partial approval applies). If an incremental authorization has been submitted, a reversal should reference original transaction data and DE 4 should be the sum of the original authorized amount plus any incremental amounts.

## Using the Clearing Optimizer Message Selection Utility to create reversals

Mastercard's Clearing Optimizer software includes a number of useful utilities, one of which is the IPM Message Selection Criteria Utility that can be used to simplify the process of creating reversal messages and files.

This utility reads a given [IPM](#) clearing file and selects messages that match the customer-specified criteria. Its output is an [IPM](#) file containing a File Header message and the messages that match the selection criteria.

A customer can use the IPM Message Selection Criteria Utility to select the messages it wants to reverse. For example, if a customer needs to reverse all first presentments submitted for the U.S. region Merit III interchange program with a transaction date of 21 August 2003, the customer can create selection criteria for these conditions. The customer uses the selection criteria as input to the IPM Message Selection Criteria Utility, along with the original file.

The utility selects all messages that match the input criteria and puts them in an output file along with the file header message of the original file. The customer would then insert PDS 0026 (File Reversal Indicator) into this file header message and optionally change the value of PDS 0105 (File ID). Finally, the customer would add a file trailer message to the end of this file, with values of all zeros in PDS 0301 (File Amount, Checksum) and PDS 0306 (File Message Counts). Then the customer would send this file to Mastercard for processing within the [Dual Message Clearing System](#).

**NOTE: For more information about the IPM Message Selection Criteria, refer to either the *Clearing Optimizer Mainframe* guide or the *Clearing Optimizer AutoEdit* guide.**

## Full File Reversal Utility

The IPM File Reversal Utility can be used for building a full file reversal.

### About IPM File Reversal Utility

Customers inadvertently send duplicate [IPM](#) clearing files to Mastercard, and it is critical that the duplicate files are reversed quickly to avoid processing and financial impact. To reverse the duplicated files, customers can use the IPM file reversal utility to easily create a full file reversal and validate the file using the Clearing Optimizer software before submitting the clearing file to Mastercard.

For example, if a customer inadvertently sent duplicate clearing files for [Dual Message Clearing System](#) processing date 29 August 2024, the impacted customer can now use the IPM file reversal utility to create a full file reversal using the processing date of 29 August 2024.

The IPM file reversal utility inserts PDS 0026 (File Reversal Indicator) in the file header with the information provided from the processing date on the Reversal Processing Date Selection field. Using the noted example, the values in PDS 0026 will be PDS 0026, subfield 1 (File Reversal Indicator) = R and PDS 0026, subfield (Central Site Processing Date of Original File) = 190829.

**NOTE: The IPM file reversal utility can be used on a clearing file with one header and one trailer. Clearing files with multiple logical files (multiple headers and trailer) cannot be used.**

For more information regarding reversals and PDS 0026, refer to [PDS 0026 \(File Reversal Indicator\)](#). It is critical to select the correct processing date for the reversal files and validate the reversal files before submitting the files to the Mastercard central site.

## Having Mastercard reverse files

Mastercard submits full file reversals at the customer's request.

Customers that want to request this service must provide the File ID of the file to be reversed and the original [Dual Message Clearing System](#) processing date of that file to their Global Customer Service team, regional office representative, or Technical Account Management representative. Mastercard uses this information to create and submit a full-file reversal as documented in the [How to send reversal files: full files](#) section.

## Editing reversal messages

The [Dual Message Clearing System](#) automatically excludes reversal messages from most interchange qualification edits. For example, the Dual Message Clearing System excludes reversal First Presentment/1240 messages from interchange timeliness and industry-related addendum requirements.

The Dual Message Clearing System does edit the file ID in all full-file reversals to ensure that it has not been previously reversed. As noted, the file ID in a reversal file does not have to be the original file ID, but it cannot be a file ID that has been used in a previous full-file reversal.

## Reporting reversal rejects

The [Dual Message Clearing System](#) generates Message Exception/1644 or File Reject/1644 messages for all rejected messages or files. Within these error messages, the Dual Message Clearing System designates reversal transactions by the presence of PDS 0025 (Message Reversal Indicator) in the individual message for individual transaction reversals and PDS 0026 (File Reversal Indicator) in the header message for full file reversals.

## Chapter 8 Reports and files

Customers receive reports and files to supplement *Dual Message Clearing System* clearing flows and services.

## Overview

The Dual Message Clearing System provides reports and files to supplement various clearing flows and services. For example, a customer may want to check the Currency Conversion Rate file (T057) to confirm the daily conversion rate or investigate the settlement figure versus the authorization amount using a reconciliation related report.

This chapter details various reports:

- Clearing submission and response: Reports generated at various junctures during the clearing process including currency conversion, [IPM](#) data, early reconciliation, and so on.
- Reconciliation related: Reports generated to assist customers with reconciling their clearing and settlement data.
- Operational reporting: Reports that provide insights into card operations and clearing related services such as [Transaction Enablement Service \(TES\)](#), [Account Level Management \(ALM\)](#), [ICCR](#), and so on.

## Clearing submission and response

### Currency conversion-related files

Currency conversion is a service that Mastercard performs to convert transaction amounts to cardholder billing amounts and reconciliation amounts. Mastercard performs this service whenever the transaction currency is different from the currency of the cardholder or the currency of reconciliation. Mastercard guarantees the Mastercard-issued currency conversion rates for each supported currency.

For more detailed information on currency conversion as a service and its functionality, refer to the currency conversion section in [System functionality and services](#).

This section discusses these files:

- T057 Currency Conversion Rate
- Acquirer Currency Conversion Rate
- Originating Institution Payment Transaction Currency Conversion Rate

### T057 Currency Conversion Rate File

All the conversion rates are delivered in a given processing day to the customers through the bulk file T057, which contains the:

- Currency Conversion Rate Detail Records
- Mastercard-Issued Cross Rates (Rate Class F)
- Mastercard-Issued USD Rates (Rate Class M)

For each Mastercard-issued rate, the reference currency is indicated in field 3 of the T057 file. The Currency Conversion Rate File provides customers with Mastercard-Issued USD Rates and Mastercard-Issued Cross Rates, in effect for a given processing day.

Customers may choose to receive the Currency Conversion Rate File through either the:

- MIP (production bulk file T057, test bulk file T058)
- CONNECT:Direct
- Mastercard File Express

## Currency Conversion Rate File format

The Currency Conversion Rate File header, detail, and trailer record layouts are shown in the following tables.

### Currency Conversion Rate File header record

| Field Number and Name      | Position | Length | Format | Comments and Values                                                                                                                                         |
|----------------------------|----------|--------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 Header Description       | 1        | 1      | an     | Constant: H                                                                                                                                                 |
| 2 Date                     | 2-9      | 8      | n      | File creation date. YYYYMMDD                                                                                                                                |
| 3 Time                     | 10-15    | 6      | n      | The time the file was created. <a href="#">Universal Time (UTC)</a> ; six digits in military format HHMMSS. For example, 3:30:30 p.m. would show as 153030. |
| 4 Rate File Format Version | 16       | 1      | an     | This field identifies the file format version. The initial version is 1 and is incremented each time the file format changes.                               |
| 5 Filler                   | 17-125   | 109    | an     | Spaces                                                                                                                                                      |

### Currency Conversion Rate File detail record

## Currency conversion rate effective day and time

The currency conversion rates used by the Dual Message Clearing System are guaranteed for each clearing processing day for transactions not eligible for rates effective at the time of authorization. For transactions eligible for rates effective at the time of authorization, refer to the Transaction Eligibility Window table in [Rates used for currency conversion](#).

## Acquirer Currency Conversion Rate File

The Acquirer Currency Conversion Rate File provides the effective currency conversion rate of all possible [International Organization for Standardization \(ISO\)](#) currency codes between the transaction currency code and the acquirer reconciliation currency code.

The files are provided for the following presentments:

- Regional First Presentments (production bulk file TQQ4, test bulk file TQQ6)
- Regional Second Presentments (production bulk file TQQ8, test bulk file TQR0)
- Intracurrency Presentments (production bulk file TQX2, test bulk file TQX4)

Customers may choose to receive the file through:

- MIP (production bulk files TQQ4, TQQ8, and TQX2; and test bulk files TQQ6, TQR0, and TQX4)
- CONNECT:Direct®
- Mastercard File Express

These files can be used when the transaction currency is not currency supported for regional settlement. This file does not replace the T057 file and customers continue to receive the T057 file. To see a full list of the currencies that Mastercard offers for regional settlement, refer to the *Settlement Manual*.

## Acquirer Currency Conversion Rate File format

The file header, detail, and trailer records for the Acquirer Currency Conversion Rate File are noted in the following tables.

### Acquirer Currency Conversion Rate File header record (Regional First Presentments)

| Field Number and Name | Position | Length | Format | Comments and Values          |
|-----------------------|----------|--------|--------|------------------------------|
| 1 Header Description  | 1        | 1      | an     | Constant: H                  |
| 2 Date                | 2-9      | 8      | n      | File creation date. YYYYMMDD |

| Field Number and Name      | Position | Length | Format | Comments and Values                                                                                                                     |
|----------------------------|----------|--------|--------|-----------------------------------------------------------------------------------------------------------------------------------------|
| 3 Time                     | 10-15    | 6      | n      | The time the file was created. <i>UTC</i> ; six digits in military format HHMMSS. For example, 3:30:30 p.m. would show as 153030.       |
| 4 Rate File Format Version | 16       | 1      | an     | This field identifies the file format version. The initial version will be 2 and will be incremented each time the file format changes. |
| 5 Filler                   | 17-60    | 44     | an     | Spaces                                                                                                                                  |

### Acquirer Currency Conversion Rate File trailer record (intracurrency presentments)

| Field Number and Name | Position | Length | Format | Comments and Values                                                                        |
|-----------------------|----------|--------|--------|--------------------------------------------------------------------------------------------|
| 1 Trailer Description | 1        | 1      | an     | Constant: T                                                                                |
| 2 Count               | 2-11     | 10     | n      | Total number of detail records. This count does not include the header or trailer records. |
| 3 Filler              | 12-60    | 49     | an     | Spaces                                                                                     |

## Application of Acquirer Currency Conversion Rate File to determine acquirer reconciliation amount

Acquirers can determine the reconciliation amount within the Acquirer Currency Conversion Rate File by both:

- Locating the record in the Acquirer Currency Conversion Rate File where the transaction currency matches the currency in field 2 and the acquirer reconciliation currency matches the currency in field 3
- Multiplying the currency conversion rate in field 5 by the transaction amount to determine the acquirer reconciliation amount

## Originating Institution Payment Transaction Currency Conversion Rate File

The Originating Institution Payment Transaction Currency Conversion Rate File gives customers the ability to determine the funding amount needed to reconcile with Mastercard specifically for cross-border payment transactions.

To assist customers in reconciling their payment transactions (data element [DE] 3, Processing Code, subfield 1, Cardholder Transaction Type Code, value 28), this rate file contains all possible currency conversion rates, from the transaction currency to the Originating Institution's reconciliation currency code for regional First Presentment payment transactions.

Customers may receive this file through either the:

- MIP (production bulk files TS40, and test bulk files TS42)
- CONNECT:Direct
- Mastercard File Express

This file does not replace the existing T057 Currency Conversion Rate File and customers continue to receive T057 rate files.

Receiving institutions that reconcile must continue reconciling using currency conversion rate information provided in the First Presentment message and must not use the Originating Institution Payment Transaction Currency Conversion Rate File.

## Originating Institution Payment Transaction Currency Conversion Rate File format

The file header, detail, and trailer records for the Originating Institution Currency Conversion Rate File are noted in the following tables.

### Originating Institution Payment Transaction Currency Conversion Rate File header

| Field Number and Name | Position | Length | Format | Comments and Values |
|-----------------------|----------|--------|--------|---------------------|
| 1 Header Description  | 1        | 1      | an     | Constant: H         |

| Field Number and Name      | Position | Length | Format | Comments and Values                                                                                                                        |
|----------------------------|----------|--------|--------|--------------------------------------------------------------------------------------------------------------------------------------------|
| 2 Date                     | 2-9      | 8      | n      | File creation date. YYYYMMDD                                                                                                               |
| 3 Time                     | 10-15    | 6      | n      | The time the file was created. <a href="#">UTC</a> ; six digits in military format HHMMSS. For example, 3:30:29 p.m. would show as 153029. |
| 4 Rate File Format Version | 16       | 1      | an     | This file identifies the file format version. The initial version will be 2 and will be incremented each time the file format changes.     |
| 5 Filler                   | 17-60    | 44     | an     | Spaces                                                                                                                                     |

#### Originating Institution Payment Transaction Currency Conversion Rate File detail record

| Field Number and Name                         | Position | Length | Format | Comments and Values                                                                                                                                                     |
|-----------------------------------------------|----------|--------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 Detail Description                          | 1        | 1      | an     | Constant: R                                                                                                                                                             |
| 2 Transaction Type Identifier                 | 2-4      | 3      | an     | Transaction Type Identifier. Valid value is:<br>• CXX (default value)                                                                                                   |
| 3 Transaction Currency Code                   | 5-7      | 3      | n      | Represents the transaction currency code of the transaction.                                                                                                            |
| 4 Originating Institution Recon Currency Code | 8-10     | 3      | n      | Represents the originating institution reconciliation currency code of the transaction.                                                                                 |
| 5 Rate Class                                  | 11       | 1      | an     | Indicates the rate classification. Valid values are:<br>• M = Mastercard-Issued U.S. Dollar Rates<br>• F = Mastercard-Issued Cross Rates<br>• X = Calculated Cross Rate |
| 6 Effective Currency Conversion Rate          | 12-26    | 15     | n      | Conversion rate (Assumed decimal after position 19). Eight positions to the left of the decimal, seven positions to the right of the decimal.                           |
| 7 Filler                                      | 27-60    | 34     | an     | Spaces                                                                                                                                                                  |

### Originating Institution Payment Transaction Currency Conversion Rate File trailer record

| Field Number and Name | Position | Length | Format | Comments and Values                                                                        |
|-----------------------|----------|--------|--------|--------------------------------------------------------------------------------------------|
| 1 Trailer Description | 1        | 1      | an     | Constant: T                                                                                |
| 2 Record Count        | 2-11     | 10     | n      | Total number of detail records. This count does not include the header or trailer records. |
| 3 Filler              | 12-60    | 49     | an     | Spaces                                                                                     |

The following steps explain how originating institutions can determine the reconciliation amount using the Originating Institution Payment Transaction Currency Conversion Rate File:

1. Locate the record in the Originating Institution Payment Transaction Currency Conversion Rate File where the:
  - Transaction Type Identifier matches the value in field 2
  - Transaction currency matches the currency in field 3
  - Originating Institution reconciliation currency matches the currency in field 4

If there is no match in field 2, then use the default value of CXX (as the Transaction Type Identifier) to match.

2. Multiply the effective currency conversion rate in field 6 by the transaction amount to determine the originating institution's reconciliation amount.

## Integrated Product Message (IPM) Mastercard Parameter Extract (MPE)

The *IPM MPE* contains all the parameters that the Clearing Optimizer uses to edit the member's clearing files and run the IPM utilities.

Full file replacement files are only distributed during the Q2 and Q4 release implementations. These are the IPM MPE Bulk file types:

- T067 Production IPM MPE generated by Mastercard from Central Site (daily updates)
- T068 Production IPM MPE generated by Mastercard from Central Site (full file replacement)
- T167 Test IPM MPE generated by Mastercard from Central Site (daily updates)
- T168 Test IPM MPE generated by Mastercard from Central Site (full file replacement)

For the layout of the MPE files, refer to the *GCMS Parameter Table Layouts* guide.

### Acknowledgment bulk files

After having applied the *BIN* updates from the *IPM MPE* bulk files, acquirer must submit corresponding acknowledgment bulk files with these IPM bulk ID values to Mastercard:

- RMF5: Acknowledgment GCMS Parameter Extract Data (daily updates)

- RMF7: Acknowledgment GCMS Parameter Extract Data (full file replace)
- RMG5: Test-Acknowledgment GCMS Parameter Extract (file daily update)
- RMG7: Test-Acknowledgment GCMS Parameter Extract (full file replace)

| Filler                  | 55-61     | an-7      | Constant value: TIME = followed by one space.                                                    |
| Time created            | 62-69     | an-8      | Time the IPM MPE Full File Replacement was generated.<br>Format: HH:MM:SS                        |
| Filler                  | 70-125    | an-56     | Spaces.                                                                                          |

## Customer-generated files in the IPM format

The [IPM](#) format provides a flexible structure for customer-generated logical and physical files.

### File types

| File type     | Description                                                                                                                                                                                            |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Logical file  | An offline file that contains a single file header, followed by various IPM clearing messages, followed by a single file trailer.                                                                      |
| Physical file | An offline transmission that is a single dataset or bulk file and that contains one or more logical files. There is no transmission header or transmission trailer to enclose an offline transmission. |

A [Dual Message Clearing System](#) limitation requires that the number of logical files within a physical file must not exceed 20,000. If the allowed limit is exceeded, then customers may be impacted by Mastercard actions to split the logical files between multiple physical files, not receiving reconciliation as expected and could miss the preferred settlement cycle.

The Dual Message Clearing System processes each logical file within a physical file independently. The transmission originator determines whether to submit a single logical file or multiple logical files within a physical file.

There are no requirements related to the grouping of IPM messages into logical files. For example, one transmission originator may choose to create a separate logical file for each ending Customer ID. Another transmission originator may choose to create one logical file for chargebacks and retrievals and another for presentments.

### Sequence of the customer-generated IPM files

Customers must adhere to certain rules when constructing IPM files.

There are relatively few sequencing rules for customer-generated logical files. The customer may construct its IPM outbound logical file using any message sequence, with the following exceptions:

- A file must begin with a file header message and end with a file trailer message.
- The file ID in the header must match the file ID in the trailer.
- DE 71 (Message Number) must contain 00000001 in the file header message. Subsequent DE 71 values must be incremented, so that each succeeding DE 71 value is greater than the previous.
- Financial detail addendum messages must immediately follow the associated first presentment messages.

### Bulk IDs for clearing data

Customers transmitting IPM clearing data through the [Mastercard interface processors](#) should use PDS 0122 (Processing Mode) and IPM bulk ID values:

- R111 Customer-generated production outbound IPM data to Central Site
- RSP1 Customer-generated production outbound IPM data to Central Site (Mexico RedMX scheme only)
- R119 Customer-generated test IPM data to Central Site
- RSP3 Customer-generated test IPM data to Central Site (Mexico RedMX scheme only)

See [Private data subelement definitions](#) for values used in PDS 0122.

## Mastercard generated files in the IPM format

Files generated by Mastercard (incoming to customers) have unique options, requirements, and structure.

These are the bulk IDs for clearing data from Mastercard:

- T112 Production IPM data generated by Mastercard from Central Site
- T120 Test IPM data generated by Mastercard from Central Site
- T113 Early Reconciliation Message file generated by Mastercard: If the customer chooses to receive this file, it provides early reconciliation and error message details after each logical file from a customer is processed
- T121 Test bulk ID for the Early Reconciliation Message file generated by Mastercard

### T112 - IPM Data File

Customers have multiple options from which they may choose to receive clearing files. These options involve timing and organization of the incoming clearing data. For more details on these options, refer to Appendix NEWXX.

### Dual Message Clearing System sequence of the IPM data file generated by Mastercard

Within a given Mastercard destination (a combination of endpoint and DE 93 [Destination ID]), the [Dual Message Clearing System](#) sequences files generated by Mastercard as shown in the table.

#### Sequence of files generated by Mastercard

|    | IPM Inbound Message Type                | IPM MTI-Function Code Combination |
|----|-----------------------------------------|-----------------------------------|
| 1. | File Header                             | 1644-697                          |
| 2. | Text Messages                           | 1644-693                          |
| 3. | Currency Updates                        | 1644-640                          |
| 4. | First Presentments                      | 1240-200                          |
| 5. | Financial Detail Addendum (if required) | 1644-696                          |

|     | IPM Inbound Message Type                                                                                                                | IPM MTI-Function Code Combination                        |
|-----|-----------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
| 6.  | Retrieval Requests                                                                                                                      | 1644-603                                                 |
| 7.  | Fee Collections (Retrieval Fee Billing)                                                                                                 | 1740-700                                                 |
| 8.  | First Chargebacks, Full and Partial                                                                                                     | 1442-450<br>1442-453                                     |
| 9.  | Second Presentments, Full and Partial                                                                                                   | 1240-205<br>1240-282                                     |
| 10. | Arbitration Chargebacks, Full and Partial                                                                                               | 1442-451<br>1442-454                                     |
| 11. | Fee Collections (non-Retrieval Fee Billing): DDDD-generated, Returns, Resubmissions, Arbitration Returns, and Clearing System-Generated | 1740-700<br>1740-780<br>1740-781<br>1740-782<br>1740-783 |
| 12. | Message Exception and File Reject                                                                                                       | 1644-691<br>1644-699                                     |
| 13. | File Currency Summary, Financial Position Details, and Settlement Position Details                                                      | 1644-680<br>1644-685<br>1644-688<br>1644-698             |
| 14. | File Trailer                                                                                                                            | 1644-695                                                 |

### T113 - Early Reconciliation Files

Early Reconciliation Service helps customers expedite their clearing reconciliation process. It provides an early acknowledgment summary of clearing transactions submitted to the Dual Message Clearing System and error messages. This service:

- Provides balancing information
- Provides error records
- Helps customers and processors make merchant prefund decisions without waiting for the next Dual Message Clearing System cutoff and distribution of notification data

## Delivery of administrative messages following clearing cycles

Customers and processors that receive early reconciliation T113 files receive their early reconciliation files when the Dual Message Clearing System has processed their outgoing files. They receive their administrative messages, such as those from Mastercard to customers, after the next available delivery cycle.

Customers and processors that elect to receive early reconciliation files receive information after all six cycles.

Customers and processors that choose not to receive early reconciliation receive all of their reconciliation messages, error messages, and messages from Mastercard to customers after the next available clearing cycle.

## Sequence of the early reconciliation file

Guidelines and processes exist for the generation and exchange of early reconciliation files between Mastercard, Dual Message Clearing System, and customers.

Customers electing to receive early reconciliation files generated by Mastercard receive one physical file for each physical file sent to Mastercard for processing. If the customer sends a physical file containing two logical files, the Dual Message Clearing System returns one early reconciliation message file. The acknowledgment reconciliation messages for the two logical files sent to Mastercard are contained in the single early reconciliation message physical file.

## Sequencing of files generated by Mastercard early reconciliation

The table shows the sequence of the files generated by Mastercard early reconciliation.

### Sequence of files generated by Mastercard early reconciliation

| MTI-Function Code | Description               | Endpoint 1, to Customer ID (ICA) |
|-------------------|---------------------------|----------------------------------|
| 1644-697          | File Header               | 004444                           |
| 1644-680          | File Currency Summary     | 002222                           |
| 1644-685          | Financial Position Detail | 003333                           |
| 1644-691          | Message Exception         | 005555                           |
| 1644-685          | Financial Position Detail | 005555                           |
| 1644-691          | Message Exception         | 006666                           |
| 1644-685          | Financial Position Detail | 006666                           |
| 1644-695          | File Trailer              | 004444                           |

For additional information on early reconciliation files and sequencing, refer to the Appendix File and Best Practices.

## Reconciliation-related reports and files

### Overview

The *Dual Message Clearing System* provides reconciliation reports to assist customers with reconciling their clearing and settlement data. The Dual Message Clearing System reports supplement reconciliation messages and facilitate customers' internal reconciliation and balancing related to Mastercard. These reports provide detail and summary information of the customer's clearing and settlement financial activity totals.

Customers can use the reports for both financial data reporting and for customer statistical data capture for analysis within customer management information systems. Once these reports are generated, the Dual Message Clearing System sends them to the customers that have requested them.

Customers can request these reports in print image format. The print image format is a standard 133-character print format that contains a one-position carriage control. The Dual Message Clearing System separates the clearing reports for accepted transactions by acknowledgment and notification clearing data. Customers requesting the reports receive them for each clearing cycle.

The Dual Message Clearing System transmits these reports using the following bulk types:

- T140: Clearing Cycle Acknowledgment Report (production)
- T150: Clearing Cycle Acknowledgment Report (test)
- T140: Clearing Cycle Notification Report (production)
- T150: Clearing Cycle Notification Report (test)

Although reconciliation messages may vary depending on customer reconciliation category selections, the reports do not vary and always provide totals for all 11 of the reconciliation categories shown in the following table.

### Reconciliation report categories

|   | Category                                   | Examples of Items in the Category                                               |
|---|--------------------------------------------|---------------------------------------------------------------------------------|
| 1 | Card Program Identifier (Acceptance Brand) | Mastercard, private label.                                                      |
| 2 | Business Service Level                     | Customer-to-customer, intracountry, intercountry, intraregional, interregional. |

|    | Category                                 | Examples of Items in the Category                                                                                                                                                                    |
|----|------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 3  | Business Service ID                      | Business Service ID number.                                                                                                                                                                          |
| 4  | Interchange Rate Designator              | The ID assigned to the specific interchange program within the business agreement identified.                                                                                                        |
| 5  | Transaction Function                     | First presentment, first chargeback, second presentment.                                                                                                                                             |
| 6  | Processing Code                          | Purchase, ATM, Unique, Payment Transaction.                                                                                                                                                          |
| 7  | Original/Reversal Transactions           | Original transactions separated from reversal transactions.                                                                                                                                          |
| 8  | Settlement Indicator                     | Settled by Mastercard, Bilateral, Global Collection Only.                                                                                                                                            |
| 9  | Reconciliation Currency/Code             | Reconciliation Currency alpha and numeric codes. These totals reflect only Mastercard settled transactions. Bilateral and Global Collection Only totals are not provided in reconciliation currency. |
| 10 | Financial and Non-Financial Transactions | Financial transactions separated from non-financial transactions.<br><br><b>NOTE: Non-financial transactions include retrieval requests and financial detail addenda.</b>                            |
| 11 | Logical File ID                          | Customer outbound logical file ID or customer inbound logical file ID.                                                                                                                               |

Customers have the option to receive Dual Message Clearing System reconciliation reports for accepted clearing data and rejected clearing data.

If the customer chooses the option to receive reconciliation reports, detailed [IPM](#) clearing reports and a summary report are generated for each of the six clearing cycles.

## Dual Message Clearing System reconciliation reports

The following table describes the Dual Message Clearing System reconciliation reports.

### Dual Message Clearing System reconciliation reports

| Report number | Report name                                                                | Description                                                                          | Categorization                                                                                                                                                                                                | Delivery formats                                                                                                                         |

For more detailed information on reconciliation and its functionality, refer to the [Reconciliation](#) section.

## IP727010-AA - Clearing Cycle Acknowledgment Report

This sample of the Clearing Cycle Acknowledgment Report shows accepted totals. The report example shown represents a complete report for an example member for Clearing Cycle 001.

This report provides a detail view of activity, for which the page number restarts at page 1 when the Acceptance Brand and Business Service ID combination changes. After all the activity pages, it also provides a summary view of each Business Service ID by Acceptance Brand/Business Service Level combination.

The detail activity view pages of this report are divided into these sections:

- Mastercard Settled Transactions
- Global Collection Only
- Non-Financial Transactions

### Clearing Cycle Acknowledgment Report sample

These sample report pages show a complete sample report for a hypothetical customer of a Dual Message Clearing Cycle 001 - Acknowledgment report. This complete sample report contains one file with four different business service arrangement IDs for two acceptance brands (DMC and MCC). Page numbering restarts at page 1 for each Acceptance Band/Business Service Arrangement combination and for the report summary and the end of the report.

| Acceptance Brand (Card Program Identifier)                                                                                       | The code for the Mastercard or proprietary service marks under whose umbrella transactions are processed. As an example, MCC (Mastercard Credit) is a card program.                                                     |
| Business Service Level                                                                                                           | Identifies the interchange relationship for the business arrangement. Examples are intracountry, intraregional, and interregional.                                                                                      |
| Business Service ID                                                                                                              | A unique code that identifies the specific interchange agreement assigned to the transaction.                                                                                                                           |
| File ID                                                                                                                          | The logical file ID to which the data in this report pertains.                                                                                                                                                          |
| Member ID                                                                                                                        | The identifier that the association assigns to a customer (also referred to as ICA number).                                                                                                                             |
| Settlement Indicator                                                                                                             | Identifies the settlement disposition of the reported transactions. Values are Mastercard Settled, Global Collection Only (no settlement), and Bilateral (no settlement).                                               |
| Trans. Func. (Transaction Function)                                                                                              | The <i>IPM Message Type Identifiers</i> and Function Code combination that defines the transaction. Examples of transaction functions are first presentment, first chargeback, and second presentment.                  |
| Proc. Code (Processing Code)                                                                                                     | Describes the effect of a transaction on a customer account and the type of account affected. Examples are purchase, credit, and ATM cash withdrawal. All transactions are defined as either an original or a reversal. |
| IRD                                                                                                                              | The interchange rate designator defines the interchange program for which the transactions were presented.                                                                                                              |
| Counts                                                                                                                           | The number of transactions accumulated for the applicable processing code.                                                                                                                                              |
| Recon Amount (Reconciliation Amount)                                                                                             | The total net amount (with fees applied) of the transactions in reconciliation currency for the applicable processing code.                                                                                             |
| <b>NOTE: Mastercard does not settle Global Collection Only and Bilateral transactions; therefore, the field contains a zero.</b> |                                                                                                                                                                                                                         |

| Field                             | Description                                                                                                                                                                                                                                                                        |
|-----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Recon Currency Code               | The numeric and alpha <i>International Organization for Standardization (ISO)</i> currency code associated with the reconciliation currency (Always 840-USD for Global Collection Only and Bilateral).                                                                             |
| Trans Fee (Transaction Fee)       | The total of the transaction fees applicable to the transactions for the processing code.<br><br><b>NOTE: Mastercard does not settle Global Collection Only and Bilateral transactions; therefore, the field contains a zero.</b>                                                  |
| Fee Curr Code (Fee Currency Code) | The numeric and alpha ISO currency code associated with the fee currency (Always 840-USD for Global Collection Only and Bilateral).                                                                                                                                                |
| Total                             | The total count and net amount (with fees applied) of the transactions and <i>reconciliation</i> currency for the applicable transaction function.                                                                                                                                 |
| Subtotal                          | The subtotal of the Mastercard-settled, Global Collection Only, or Bilateral transaction amounts for the specified business service level.<br><br><b>NOTE: Mastercard does not settle Global Collection Only and Bilateral transactions; therefore, the field contains a zero.</b> |

## IP727020-AA - Clearing Cycle Notification Report

This sample of the Clearing Cycle Notification Report shows accepted totals. The report reflects Mastercard Settled Transactions. The report example shown represents a complete report for an example member for Clearing Cycle 001.

### Clearing Cycle Notification Report sample

These figures show a sample of a Mastercard-settled Clearing Cycle 001 - Acknowledgment report. This sample contains one file with seven different business service arrangement IDs. Page numbering restarts at page 1 for each new Business Service ID.

### Report IP727020-AA field descriptions

| Field                                               | Description                                                                                                                                                                                                                     |
|-----------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Run Date                                            | The date on which this report was produced.                                                                                                                                                                                     |
| Page                                                | The page number within the report.                                                                                                                                                                                              |
| Acceptance Brand (Card Program Identifier)          | The code for the Mastercard or proprietary service marks under whose umbrella transactions are processed. As an example, MCC (Mastercard Credit) is a card program.                                                             |
| Business Service Level                              | Identifies the interchange relationship for the business arrangement. Examples are intracountry, intraregional, and interregional.                                                                                              |
| Business Service ID                                 | A unique code that identifies the specific interchange agreement assigned to the transaction.                                                                                                                                   |
| File ID                                             | The logical file ID to which the data in this report pertains.                                                                                                                                                                  |
| Member ID                                           | The identifier that the association assigns to a customer (also referred to as ICA number).                                                                                                                                     |
| Settlement Indicator                                | Identifies the settlement disposition of the reported transactions. Values are M: Mastercard Settled and B: Bilateral (no settlement).                                                                                          |
| Trans. Func. (Transaction Function)                 | The <i>IPM MTI</i> and Function Code combination that defines the transaction. Examples of transaction functions are first presentment, first chargeback, and second presentment.                                               |
| Proc. Code (Processing Code)                        | Describes the effect of a transaction on a customer account and the type of account affected. Examples are purchase, payment credit, and ATM cash withdrawal. All transactions are defined as either an original or a reversal. |
| IRD                                                 | The interchange rate designator defines the interchange program for which the transactions were presented.                                                                                                                      |
| Counts                                              | The number of transactions accumulated for the applicable processing code.                                                                                                                                                      |
| Recon. Amount (Reconciliation Amount)               | The total net amount (with fees applied) of the transactions in reconciliation currency for the applicable processing code.                                                                                                     |
|                                                     | <b>NOTE: Mastercard does not settle Global Collection Only and Bilateral transactions; therefore, the field contains a zero.</b>                                                                                                |
| Recon. Currency Code (Reconciliation Currency Code) | The numeric and alpha <i>International Organization for Standardization (ISO)</i> currency code associated with the reconciliation currency (Always 840-USD for Global Collection Only and Bilateral).                          |

| Field                              | Description                                                                                                                                                                                                                                                                        |
|------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Trans. Fee (Transaction Fee)       | The total of the transaction fees applicable to the transactions for the processing code.<br><br><b>NOTE: Mastercard does not settle Bilateral transactions; therefore, the field contains a zero.</b>                                                                             |
| Fee Curr. Code (Fee Currency Code) | The numeric and alpha <a href="#">ISO</a> currency code associated with the fee currency (always 840-USD for Bilateral).                                                                                                                                                           |
| Total                              | The total count and net amount (with fees applied) of the transactions in reconciliation currency for the applicable transaction function.                                                                                                                                         |
| Subtotal                           | The subtotal of the Mastercard settled, Global Collection Only, or bilateral transaction amounts for the specified Business Service level.<br><br><b>NOTE: Mastercard does not settle Global Collection Only and Bilateral transactions; therefore, the field contains a zero.</b> |

## IP728010-AA - Clearing Cycle Summary Reconciliation Report

The [Dual Message Clearing System](#) generates the Clearing Cycle Summary Reconciliation Report once per clearing cycle. This optional report gives customers an additional reconciliation tool by providing specific clearing totals summarized by the clearing cycle.

Summary information from the IP727010-AA Clearing Cycle Acknowledgment report shows under the heading of "File ID To Mastercard." Summary information from the IP727020-AA Clearing Cycle Notification report shows under the heading "File ID From Mastercard."

This report includes reconciliation totals for these categories:

- Acceptance Brand
- Business Service Level and ID
- Customer ID (sender or receiver)
- Logical file ID to Mastercard or logical file ID from Mastercard
- Totals in the appropriate reconciliation currency, including the reconciliation currency code

### Clearing Cycle Summary Reconciliation Report sample

These figures show samples of Clearing Cycle 001 summary reconciliation reports for when:

- The customer sends the logical file ID to Mastercard
- The customer receives the logical file ID from Mastercard

ICAs acting as both the sender and receiver may receive a report containing files with logical file IDs in both the File ID to Mastercard and File ID from Mastercard fields.

|---------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| Business Service Level                      | Identifies the interchange relationship for the business arrangement. Examples are intracountry, intraregional, and regional.                         |
| Business Service ID                         | A unique code that identifies the specific interchange agreement assigned to the transaction.                                                         |
| Member ID                                   | The identifier that the association assigns to a customer (also referred to as ICA number).                                                           |
| Cycle Activity                              | The clearing cycle in which the file was processed by the Dual Message Clearing System.                                                               |
| File ID To Mastercard                       | The logical file ID of the file sent by the customer to Mastercard to which the net amounts apply.                                                    |
| File ID From Mastercard                     | The logical file ID of the file sent by Mastercard to the customer to which the net amounts apply.                                                    |
| Net Reconciliation Currency Amount          | The total net amount (with fees applied) of the transactions in reconciliation currency for the applicable logical file ID.                           |
| Reconciliation Currency Code                | The numeric and alpha <a href="#">International Organization for Standardization (ISO)</a> currency code associated with the reconciliation currency. |
| Clearing Day Total As Of Clearing (001-006) | The grand total net amount (with fees applied) for the specified clearing day as of clearing cycle NNN.                                               |

## IP142110-AA - IPM Messages Created on Behalf of a Member

Customers that receive [IPM](#) Acknowledgment Reconciliation messages receive acknowledgments for Fee Collection/1740 messages that they did not generate.

Mastercard creates this report to assist customers in their reconciliation process. Mastercard generates this report in each clearing cycle only if the customer had activity.

The [Dual Message Clearing System](#) report IP142110-AA (IPM Clearing Messages Created On Behalf of a Customer) has two additional receipt options:

- Text file available in raw data, variable length version. The bulk types are TN70 (Production) and TN72 (Test) for outbound file delivery.
- XML data file available in variable length version. The bulk types are TN66 (Production) and TN68 (Test) for outbound file delivery.

The data files are created and distributed after each clearing cycle. The data files do not include summary totals. If no data is available, the customer receives a header and trailer only, with record count 0.

When multiple Customer IDs are packaged in a single file to the same endpoint, the data is sequenced by Customer ID. A header and trailer are provided for each Customer ID.

Both data files contain the same fields that are currently on the IP142110-AA report. In addition, the data files contain the following fields. These fields are not be added to the IP142110-AA print report.

#### IP142110-AA fields

| Name                                             | Description                                                                                                                                                                                                                                       |
|--------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Central Site Processing Date of Original Message | Contains the value in PDS 0025 (Message Reversal Indicator), subfield 2 (Central Site Processing Date of Original Message). If PDS 0025, subfield 2 is present because the transaction is being reversed, the original message date is displayed. |
| File ID                                          | For the IP142110-AA report and data files, the File ID is the Mastercard Source File ID. The File ID is found in PDS 0105 (File ID).                                                                                                              |

The XML file version of the report contains this data layout.

## IP142520-AA - On-behalf Service Fee Collection Report

Mastercard offers this [Dual Message Clearing System](#) reconciliation summary report (On-behalf Service Fee Collection Report) to acquirers in the Europe region to allow reconciliation and settlement of the ATM non-financial fee collection messages created on their behalf. Customers can sign up for this report.

Europe acquirers can receive the consolidated clearing report, On-behalf Service Fee Collection Report (IP142520-AA):

- In four clearing cycles per day (cycle 1, 2, 4, and 5) and distributed as part of bulk type T140 (Production) and T150 (Test).
- On the next clearing cycle if there is an issue with the generation of the report on one of the four cycles listed previously.

In addition to the On-behalf Service Fee Collection Report, acquirers can also request the text file or XML data file format:

- Text file: available in raw data, variable length version. The bulk types are TN70 (Production) and TN72 (Test) for outbound file delivery.
- XML Data file: available in variable length version. The bulk types are TN66 (Production) and TN68 (Test) for outbound file delivery.

Customers should indicate their format preference by contacting their account manager or the Mastercard Customer Implementation Services team.

## IP148320-AA - Miscellaneous Override Financial Adjustments Report

The Miscellaneous Override Financial Adjustments report is available to customers each processing day and is distributed as part of bulk file type T140.

The report provides details about the Mastercard Fee Collection/1740 messages containing reason code 7808 in the Clearing Cycle Notification Report (IP727020-AA) that are generated at the account range level.

Issuers and processors can elect to receive the Miscellaneous Override Financial Adjustments Report. Customers should indicate their format preference by contacting their account manager or the Mastercard Customer Implementation Services team.

The *Dual Message Clearing System* Miscellaneous Override Financial Adjustments report (IP148320-AA) has two additional receipt options:

- The text file is available in raw data, variable length version. The bulk type is TN70 (Production).
- The XML data file is available in variable length version. The bulk type is TN66 (Production).

The data files are created and distributed after each processing day. The data files do not include summary totals. If no data is available, the customer receives a header and trailer only, with record count 0.

When multiple Customer IDs are packaged in a single file to the same endpoint, the data is sequenced by Customer ID. A header and trailer is provided for each Customer ID.

The Miscellaneous Override Financial Adjustments Report (IP148320-AA) includes Settlement Service and Submitted Fee Collection Amount.

The XML file version of the report contains the data shown in the following layout.

#### XML data file distribution

| Record Type | Field Name      | Field Format | Field Value | Justification |
|-------------|-----------------|--------------|-------------|---------------|
| Header      | Record Type     | PIC X(01)    | H           | Left          |
|             | Distribution ID | PIC X(16)    | IP148320-AA | Left          |
|             | Member ID       | PIC 9(11)    |             | Right         |
|             | Endpoint        | PIC X(07)    |             | Left          |

| Record Type | Field Name             | Field Format | Field Value                      | Justification |
|-------------|------------------------|--------------|----------------------------------|---------------|
| Detail      | Record Type            | PIC X(01)    | D                                | Left          |
|             | Member ID              | PIC X(11)    |                                  | Left          |

## IP755120-AA - Clearing Detail Report

The Clearing Detail Report (IP755120-AA) is offered to acquirers to facilitate acquirer reconciliation. Customers can sign up for this report delivered through bulk file TN70 (Production) and TN72 (Test).

Mastercard generates and sends the Clearing Detail Report at the end of each clearing cycle for all activity in that cycle.

If the Clearing Detail Report record does not contain data for the customer, then the customer only receives the header and trailer for the file.

The report (in the form of a raw data file) provides acquirers transaction-level details from the [Dual Message Clearing System](#), including the currency conversion rate from the transaction amount to the acquirer reconciliation amount in DE 9 (Conversion Rate, Reconciliation).

Per transaction, the report contains the Detail Record. For the corresponding DE and PDS, refer to [Data element and private data subelement definitions and details](#).

The report also includes header, detail, and trailer records (with the total number of records for detail records only).

### Header record

| Field ID | Length  | Comments             |
|----------|---------|----------------------|
| 1        | ans-17  | Value 'HIP755120-AA' |
| 2        | n-11    | ICA                  |
| 3        | n-07    | Endpoint             |
| 4        | ans-639 | Filler of spaces     |

## IP755220-AA-ALM Reconciliation Data Report

### ALM Reconciliation Data Report (IP755220-AA)

The Account Level Management (ALM) Reconciliation Data Report is offered to acquirers to use with the Interchange Detail Report (IP755020-AA) and Clearing Detail Report (IP755120-AA) to help facilitate acquirer reconciliation. This report is generated and sent after each clearing cycle. Customers can sign up for this report delivered through bulk file TN70 (Production) and TN72 (Test).

The report (in the form of a raw data file) includes PDS 0275 (Account Level Management Service Data) and PDS 0276 (Fee Amounts, Additional), along with other IPM clearing data, and enables acquirers to match transaction records within their existing back-end systems, or by matching the transaction records within the IP755020/IP755120 reports.

The IP755220-AA report will contain records for any account range that participates in ALM and/or Mastercard One Credential, as well as ALM program/Business Service combinations that have migrated to the new ALM service. Transactions that contain a PAN not registered for the ALM or Mastercard One Credential service are not included in the report. In addition, ALM or Mastercard One Credential transactions for which the ALM Service Code indicates an error are not included in the report. Some processing conditions may create a record for transactions that did not have ALM or Mastercard One Credential Funding PAN interchange applied. For example,

purchase return and refund transactions within some countries that participate in ALM but do not apply to ALM interchange. Acquirers can determine if ALM interchange was applied to a transaction by referencing two PDS 0276 subfield values within the IP755220-AA records.

PDS 0276, subfield 2 (Override Hierarchy) will contain a non 00 value (01 through 11) if a product class override was applied for the ALM Product Graduation program.

PDS 0276, subfield 1 (Rate Type) will be populated with one of the 8nn Rate Type values directly associated with ALM when an adjustment is applied to the Base Rate amount (as shown in the PDS 0276 occurrence with subfield 1 (Rate Type) 001 for non-Product Graduation programs, for example, Enhanced Value.

The report includes header, detail, and trailer records (with the total number of records for detail records only). These records include the Global Clearing Management System Report ID, which will be IP755220-AA.

Per transaction, the new report will contain the following Detail Record. For the corresponding DE and PDS, refer to the *Mastercard Network Processing Dual Message Clearing System Guide*.

#### Header record

| Field ID | Length  | Comments           |
|----------|---------|--------------------|
| 1        | ans-17  | Value HIP755220-AA |
| 2        | n-11    | ICA                |
| 3        | n-07    | Endpoint           |
| 4        | ans-664 | Space Filler       |

#### Detail record

| Field name                   | DE           | PDS | Subfield | Length | Starting position |

| File ID                                               |    | 0105 |          | 25     | 640               |
| Acquirer Submitted IRD                                |    |      |          | 2      | 665               |
| Mastercard Transaction Calculator Derived IRD         |    |      |          | 2      | 667               |
| Reversal Indicator                                    |    | 0025 | 1        | 1      | 669               |
| Mastercard Assigned ID (MAID)                         |    | 0176 |          | 6      | 670               |
| ALM Service Data Related to Mastercard One Credential |    | 0275 | 6-8      | 23     | 676               |
| Mastercard One Credential Exclusion Indicator         |    | 0217 | 1        | 1      | 699               |

**NOTE: PDS 0276 (Fee Amounts, Additional) provides all fee amounts associated with transactions that have processed for ALM. This PDS may accommodate one to eight fee amount occurrences. GCMS will populate PDS 0276 in the IP755220-AA detail record with all eight fee amounts and any unused occurrences will be space filled.**

**NOTE: PDS 0275, subfield 8 is a variable length field. GCMS will populate PDS 0275, subfield 8 in the IP755220-AA detail record with 19 positions, space-filled at the end.**

### Trailer record

| Field ID | Length  | Comments                     |
|----------|---------|------------------------------|
| 1        | ans-17  | Value of IP755220-AA         |
| 2        | n-11    | ICA                          |
| 3        | n-07    | Endpoint                     |
| 4        | n-12    | Total of detail records only |
| 5        | ans-652 | Space filler                 |

Mastercard sends the IP755220-AA Clearing Detail File at the end of each clearing cycle for all activity in that clearing cycle.

**NOTE: If the Clearing Detail File Record does not contain data for the customer, then the customer receives only the header and trailer for the Clearing detail file.**

## Operational reporting

Operational reports provide issuers, acquirers, and processors insights into their card operations.

This section discusses:

- Optional reports such as reports detailing rejected transaction data
- Dual Message Clearing System transaction and chargeback reports
- Optional service reports such as:
  - [Transaction Enablement Service \(TES\)](#), [Account Level Management \(ALM\)](#), [ICCR](#), and acquirer reward presentments created on behalf of a customer
  - Cross-border fee manager reports

## Optional reports

The [Dual Message Clearing System](#) provides rejected transaction data through the Error Detail: Input Sequence report and the Global Collection Only Error Detail: Input Sequence report. These

reports provide all DE of a rejected message, including data that fails edits and data that passes edits, highlighting the DE in an error.

These reports include rejected transaction details at the following levels:

- Logical file to Mastercard
- Processing Mode (Test or Production)
- Source Message Number
- Source Currency
- Source Amount
- Transaction Function
- Global Collection Only separated from non-Global Collection Only rejected transactions

The Error Detail: Input Sequence reports are optional. The Dual Message Clearing System transmits this report using bulk type T140 for production and bulk type T150 for test reports. Customers that request these reports receive them after each clearing cycle.

Global Collection Only Error Detail: Input Sequence Report (IP857010-BB), Message Level Reject field descriptions

| Field    | Description                                 |
|----------|---------------------------------------------|
| Run Date | The date on which this report was produced. |

| Field                 | Description                                                                                                                                                                                          |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Page                  | The page number within the report.                                                                                                                                                                   |
| File ID               | The logical file ID of the customer-generated file to which the data in this report pertains.                                                                                                        |
| Processing Mode       | Type of processing (Production or Test) performed on this file.                                                                                                                                      |
| Source Message Number | Number of the original message that contains the error, from DE 71 (Message Number).                                                                                                                 |
| Source Amount         | Monetary amount of the rejected message. For messages without a DE 4 (Amount, Transaction) value (for example, retrieval fee billing or financial detail addendum messages), the field will be zero. |
| MTI: Function Code    | The <a href="#">Message Type Identifier (MTI)</a> and the Function Code associated with the rejected message.                                                                                        |
| Source Currency       | The alphabetic currency code associated with the monetary amount.                                                                                                                                    |
| Error Code            | A unique code (established by Mastercard) that identifies the type of error encountered.                                                                                                             |
| Description           | A detailed description of the error encountered.                                                                                                                                                     |
| Source Message Number | Number of the original message that contains the error, from DE 71 (Message Number).                                                                                                                 |
| Source Element ID     | Identifies the element for which Dual Message Clearing System encountered the reject condition.                                                                                                      |
| Invalid Data          | Listing of the contents of the element within the rejected message.                                                                                                                                  |
| Message Details       | Details about the message.                                                                                                                                                                           |

**Global Collection Only Error Detail: Input Sequence Report (IP857010-BB), Message Level Reject (alternate) field descriptions**

| Field                 | Description                                                                                                                                  |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| Run Date              | The date on which this report was produced.                                                                                                  |
| Page                  | The page number within the report.                                                                                                           |
| File ID               | The logical file ID of the customer-generated file to which the data in this report pertains.                                                |
| Processing Mode       | Type of processing (Production or Test) to be performed on this file.                                                                        |
| Error Code            | A unique code (established by Mastercard) that identifies the type of error encountered.                                                     |
| Description           | A detailed description of the error encountered.                                                                                             |
| Source Message Number | Number of the original message that contains the error, from DE 71 (Message Number).                                                         |
| Element ID            | The number of the data element or private data subelement causing the error condition.                                                       |
| Invalid Data          | Listing of the contents of the data element or private data subelement in error, within the rejected message.                                |
| Message Unparseable   | Contains up to the first 200 positions of the rejected message when the Dual Message Clearing System cannot parse the message into elements. |

| Page                  | The page number within the report.                                                                                                                           |
| File ID               | The logical file ID of the customer-generated file to which the data in this report pertains.                                                                |
| Processing Mode       | Type of processing (Production or Test) performed on this file.                                                                                              |
| Message Type          | Identifies whether the message has a settlement indicator of settled by Mastercard, bilateral (not settled by Mastercard), or Global Collection Only.        |
| Financial Detail      | Identifies messages that have monetary impact.                                                                                                               |
| Non-Financial Detail  | Identifies messages that do not have monetary impact.                                                                                                        |
| Unrecognizable Detail | Identifies messages that cannot be parsed.                                                                                                                   |
| Currency              | The alphabetic currency code of the source currency.                                                                                                         |
| Amount                | The net total of the source monetary amount of the messages. Messages that do not include a DE 4 (Amount, Transaction) value are not included in this field. |
| Count                 | The total number of messages.                                                                                                                                |

## IP857010-AA - Error Detail -- Input Sequence

|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| File ID               | The logical file ID of the customer-generated file to which the data in this report pertains.                                                                                                        |
| Processing Mode       | Type of processing (Production or Test) performed on this file.                                                                                                                                      |
| Source Message Number | Number of the original message that contains the error, from DE 71 (Message Number).                                                                                                                 |
| Source Amount         | Monetary amount of the rejected message. For messages without a DE 4 (Amount, Transaction) value (for example, retrieval fee billing or financial detail addendum messages), the field will be zero. |
| MTI-Function Code     | The <a href="#">Message Type Identifier (MTI)</a> and the DE 24 (Function Code) value associated with the rejected message.                                                                          |
| Source Currency       | The alphabetic currency code associated with the monetary amount.                                                                                                                                    |
| Error Code            | A unique code (established by Mastercard) that identifies the type of error encountered.                                                                                                             |
| Description           | A detailed description of the error encountered.                                                                                                                                                     |
| Source Message Number | Number of the original message that contains the error, from DE 71 (Message Number).                                                                                                                 |
| Element ID            | The number of the data element or private data subelement causing the error condition.                                                                                                               |
| Invalid Data          | Listing of the contents of the data element or private data subelement in error, within the rejected message (This information prints only for message level rejects).                               |
| Message Details       | Details about the message.                                                                                                                                                                           |

| Field                 | Description                                                                                                                                                  |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Run Date              | The date on which this report was produced.                                                                                                                  |
| Page                  | The page number within the report.                                                                                                                           |
| File ID               | The logical file ID of the customer-generated file to which the data in this report pertains.                                                                |
| Processing Mode       | Type of processing (Production or Test) performed on this file.                                                                                              |
| Message Type          | Identifies whether the message has a settlement indicator of settled by Mastercard, bilateral (not settled by Mastercard), or Global Collection Only.        |
| Financial Detail      | Identifies messages that have monetary impact.                                                                                                               |
| Non-Financial Detail  | Identifies messages that do not have monetary impact.                                                                                                        |
| Unrecognizable Detail | Identifies messages that cannot be parsed.                                                                                                                   |
| Currency              | The alphabetic currency code of the source currency.                                                                                                         |
| Amount                | The net total of the source monetary amount of the messages. Messages that do not include a DE 4 (Amount, Transaction) value are not included in this field. |
| Count                 | The total number of messages.                                                                                                                                |

## Dual Message Clearing System transaction and chargeback analysis reports

These tables and figures provide details about [Dual Message Clearing System](#) transaction and chargeback analysis reports, such as the bulk types through which they are transmitted, the versions in which they appear, and the descriptions of their fields.

The transaction and chargeback analysis reports include:

- Global Clearing Management System Transaction/Chargeback Analysis Report (IP776010-AA)
- Chargeback Activity Summary: Acquirer (IP776020-AA)
- Dollar/Volume Summary Report: Acquirer (IP776030-AA)

The Dual Message Clearing System uses the T783 (production) and T784 (test) bulk types to transmit these reports.

These three reports have three versions with the same layout.

### Report layouts

| Version... | Summarizes activity by...           |
|------------|-------------------------------------|
| -AA        | Acquirer                            |
| -BB        | Issuer                              |
| -CC        | Dual Message Clearing System totals |

Because the layouts are the same, the following samples show only the -AA version.

These reports are available in media types:

- Mastercard Network/Bulk
- Mastercard File Express
- CONNECT:Direct

| Representment Credit Reversals          | Total number and associated dollar volume of reversal credit Second Presentment/1240-205 (Full) and 1240-282 (Partial) messages.                                                                     |
| Retrieval Requests                      | Total number and associated dollar volume of non-reversal Retrieval Request/1644-603 messages.                                                                                                       |
| Retrieval Request Reversals             | Total number and associated dollar volume of reversal Second presentment/1240-205 (Full) and 1240-282 (Partial) messages.                                                                            |
| Retrieval Request Fulfillments          | Total number and associated dollar volume of non-reversal Mastercom and manual (non-Mastercom) fulfillment activity.                                                                                 |
| Retrieval Request Fulfillment Reversals | Total number and associated dollar volume of reversal Mastercom and manual (non-Mastercom) fulfillment activity.                                                                                     |

## Optional service-related reports

Customers can sign up to receive reports for specific services.

This section describes the following reports:

- Acquirer Accepted Errors Detail Report - this report relates to [TES](#). For more information on TES, refer to the Mastercard Transaction Enablement Service section in [Services or products leveraging the system](#).
- Account Level Management (ALM) Reconciliation Data (IP755220-AA) - for more information on ALM, refer to the Account Level Management section in [Services or products leveraging the system](#).
- Acquirer-funded Reward Present Created on Behalf of a Customer Report (IP170010-AA)

- Issuer ICCR (IP830010) - for more information on [ICCR](#), refer to the ICCR section in [Services or products leveraging the system](#).
- Cross-Border Fee Manager service reports (IP830020) - for more information on Cross-Border Fee Manager service, refer to the Cross-Border Fee Manager service section in [Services or products leveraging the system](#).

## IP714010-AA - Acquirer Accepted Errors Detail Report

The [Transaction Enablement Service \(TES\)](#) is an optional service.

**NOTE: Currently, this service is only available for Brazil.**

TES aims to minimize clearing rejections due to edit validations by fixing these errors on behalf of acquirers, ensuring the integrity of the network by providing correct data to issuers based on Mastercard rules where possible.

If the [MCC](#) provided in DE 26 (Card Acceptor Business Code [MCC]) for domestic First Presentment/1240 messages submitted by the acquirer is not valid for the Merchant Tax ID provided in PDS 0220 (Brazil Merchant Tax ID), then Mastercard replaces it with a valid MCC to ensure that the transaction is not rejected with the Dual Message Clearing System error 3007.

All Dual Message acquirers in Brazil are automatically enrolled into the service, therefore there is no action acquirers need to take to benefit from the service.

The raw data file, IP714010-AA (Acquirer Accepted Errors Detail Report) transmitted within the existing TN70 (prod)/TN72 (test) bulk file types, contains reconciliation data for Transaction Enablement Service participants and is available to acquirers only by request through Customer Support.

The file contains the data elements and subelements adjusted by the Dual Message Clearing System. This file only contains data pertaining to First Presentment (1240-200) messages that cleared successfully.

This raw report date file can be differentiated by the header and trailer record of each report within the raw data bulk file.

The IRD field in this layout is not applicable for Brazil; therefore, the Original IRD field contains spaces. The Original MCC field applies to Brazil only.

### Header Record

| Field ID | Length | Comments           |
|----------|--------|--------------------|
| 1        | ans-17 | Value HIP714010-AA |
| 2        | n-11   | ICA                |
| 3        | n-07   | Endpoint           |

| Field ID | Length  | Comments         |
|----------|---------|------------------|
| 4        | ans-683 | Filler of spaces |

### Detail Record

| Field name                               | DE           | PDS | Subfield | Length | Starting position |

## IP755140-AA-Clearing Interchange Enhancement Reconciliation Report

The Clearing Interchange Enhancement Reconciliation Data Report (IP755140-AA) is offered to acquirers to use in conjunction with the Clearing Detail Report (IP755120-AA) to help facilitate acquirer reconciliation. Customers can sign up for this report delivered within bulk files TN70 (Production) and TN72 (Test).

The IP755140-AA report contains specific details of clearing messages in which the acquirer-provided IRD in PDS 0158 (Business Activity), subfield 4 (Interchange Rate Designator) is different than the IRD derived by the clearing system.

The report is generated and sent after each clearing cycle, including cycle seven.

The following tables contain record layouts for the header, detail, and trailer records within the TN70 and TN72 bulk files. The trailer record contains only the total number of detail records for the given ICA. The header and trailer records are not included in this total. These records include the GCMS Report ID, which will be IP755140-AA. For the corresponding data element (DE) and PDS details, refer to the *Mastercard Network Processing Dual Message Clearing System Guide*.

### Header record

| Field ID | Length | Comments           |
|----------|--------|--------------------|
| 1        | ans-17 | Value HIP755140-AA |
| 2        | n-11   | ICA                |
| 3        | n-07   | Endpoint           |

### Detail record

| Field name                               | DE           | PDS  | Subfield   | Length | Starting position |

### Trailer record

| Field ID | Length | Comments                     |
|----------|--------|------------------------------|
| 1        | ans-17 | Value TIP755140-AA           |
| 2        | n-11   | ICA                          |
| 3        | n-07   | Endpoint                     |
| 4        | n-12   | Total of detail records only |

Mastercard sends the Clearing Detail File at the end of each clearing cycle for all activity in that clearing cycle.

**NOTE: If the Clearing Detail File Record does not contain data for the customer, then the customer receives only the header and trailer for the Clearing detail file.**

## IP755220-AA - Account Level Management (ALM) Reconciliation Data Report

The Account Level Management (ALM) Reconciliation Data Report is offered to acquirers to use with the Interchange Detail Report (IP755020-AA) and Clearing Detail Report (IP755120-AA) to facilitate acquirer reconciliation.

This report is generated and sent after each clearing cycle. Customers can sign up for this report delivered through bulk file TN70 (Production) and TN72 (Test).

The report (in the form of a raw data file) includes PDS 0275 (Account Level Management Service Data) and PDS 0276 (Fee Amounts, Additional), along with other [IPM](#) clearing data, and enables acquirers to match transaction records within their existing back-end systems or by matching the transactions records within the IP755020/IP755120 reports.

The IP755220-AA report contains records for any account range that participates in ALM, as well as ALM program/Business Service combinations that have migrated to the new ALM service. ALM transactions with the 'PAN not registered' service code or service errors are not included. Some processing conditions may create a record for transactions that did not have ALM interchange applied. Acquirers can determine if ALM interchange was applied to a transaction by referencing two PDS 0276 subfield values within the IP755220-AA records.

Per transaction, the new report contains the following Detail Record. For the corresponding data element and private data subelement, see the [Data element and private data subelement definitions and details](#) section.

### Header record

| Field ID | Length  | Comments             |
|----------|---------|----------------------|
| 1        | ans-17  | Value 'HIP755220-AA' |
| 2        | n-11    | ICA                  |
| 3        | n-07    | Endpoint             |
| 4        | ans-566 | Space filler         |

| 2        | n-11    | ICA                          |
| 3        | n-07    | Endpoint                     |
| 4        | n-12    | Total of detail records only |
| 5        | ans-554 | Space filler                 |

## IP170010-AA - Acquirer-funded Reward Presentments Created On Behalf of a Customer Report

The Reward Presentments Created on Behalf of a Customer Report (IP170010-AA) aids acquirers in reconciling promotions that are merchant-funded, providing acquirers with a recap of the merchant-funded promotions.

Acquirers can receive the consolidated clearing report, Acquirer-funded Reward Presentments Created on Behalf of a Customer Report (IP170010-AA):

- In each clearing cycle, and distributed as part of bulk type T140 (Production) and T150 (Test) only if the customer had activity.
- By transaction origination, customer reconciliation indicator (reward program ID), acceptor, and transaction currency.

When the program is the Merchant Partner Program, the report ID is IP702010-AA.

Totals are provided by transaction currency and reconciliation currency.

In addition to the Acquirer-funded Reward Presentments Created on Behalf of a Customer Report, the customer can request the text file or XML data file format:

- Text file: available in raw data, variable length version. The bulk types are TN70 (Production) and TN72 (Test) for outbound file delivery.
- XML Data file: available in variable length version. The bulk types are TN66 (Production) and TN68 (Test) for outbound file delivery.

## Consolidated on-request XML data file distribution

Customers who request a raw data file version of a report receive the data using default layouts.

### Default layouts

| Record Type | Field Name        | Field Format             | Field Value                                           |
|-------------|-------------------|--------------------------|-------------------------------------------------------|
| Header      | Filler            | PIC X(01)                | H                                                     |
|             | Distribution File | PIC X(16)                | IP170010-AA: when<br>Funds Transfer Fee<br>Collection |

**NOTE:**

Customers that request an XML data file version of a report receive the same data as above but in XML format.

For customers that elect to receive the text file, when no data is present, the file consists of a header and trailer record with zero (0) for the record count.

## IP830010 - Issuer ICCR Report

Issuers participating in the [ICCR](#) service can choose to receive daily audit report files that align with each clearing cycle from the Dual Message Clearing System.

This audit report is transmitted within the existing TN70 (prod)/TN72 (test) bulk file types and is available for the clearing transactions for which the ICCR calculation was performed.

## Region-specific reports

This section discusses these region-specific reports:

- Interchange Detail Report
- Mexico RedMX scheme reports

## IP755020-AA - Interchange Detail Report

The Interchange Detail Report (IP755020-AA) is offered to acquirers in the Europe region and South Africa to comply with regulatory requirements by providing details regarding their fees, including the interchange amounts applied per transaction.

Customers can sign up for this report. This report is transmitted within the existing TN70 (prod) / TN72 (test) bulk file types.

The report (in the form of a raw data file) provides acquirers automated access to the following detailed information per transaction after each clearing cycle:

- [Primary Account Number \(PAN\)](#)
- Transaction and interchange amounts
- Interchange details including the interchange amount actually applied by the Dual Message Clearing System
- Merchant details
- Transaction identifiers to allow easy reconciliation with the acquirer's internal data
- PDS 0159: Settlement Data (Acquirer Settlement Data)

Per transaction, the report contains the following Detail Record. For the corresponding data element and private data subelement, refer to [Data element and private data subelement definitions and details](#).

The report uses fixed field lengths in fixed positions.

### Header record

#### Trailer record

| Field ID | Length | Comments                     |
|----------|--------|------------------------------|
| 1        | an-17  | Value of 'TIP755020-AA'      |
| 2        | an-11  | ICA                          |
| 3        | an-07  | Endpoint                     |
| 4        | n-12   | Total of detail records only |

One report is sent at the end of each clearing cycle for all activity in that clearing cycle. If no activity has occurred in a clearing cycle, then an empty report is sent with just a Header and a Trailer record.

The report includes:

- Purchase transactions
- Refund transactions
- ATM cash withdrawal transactions
- Manual cash disbursement transactions
- Purchase with cash back transactions
- Payment Transactions (including Gaming Payment Transactions and MoneySend Payment Transactions)
- Unique transactions
- Clearing reversals (if this is accurate)

Acquirers can choose between two versions.

- Version 1: Acquirer only activity
  - First presentments and reversals
  - Second presentments and reversals
- Version 2: Acquirer and Issuer activity
  - First presentments and reversals
  - Second presentments and reversals
  - First chargebacks and reversals

## Mexico RedMx Scheme reports

For information on the IP714870-AA Misc. Fees Inbound from MxDS and IP714880-AA Misc. Fees Outbound to MxDS reports, refer to the *Mexico Domestic Switching Acquirer Implementation Guide*.

## Summary of reports within raw data files

This section lists the reports contained within raw data files mentioned throughout this chapter.

### Text file available in raw data, variable length version

The bulk types are TN70 (Production) and TN72 (Test) for outbound file delivery. These are the text files:

- IP142110-AA - IPM Clearing Messages Created On Behalf of a Customer
- IP142520-AA - On Behalf Service Fee Collection
- IP148320-AA - Miscellaneous Override Financial Adjustments
- IP755120-AA - Clearing Detail
- IP714010-AA - Acquirer Accepted Errors Detail
- IP755220-AA - ALM Reconciliation Data
- IP170010-AA - Acquirer-funded Reward Present Created On Behalf
- IP702010-AA - Acquirer-funded Reward Present Created On Behalf
- IP830010 - Issuer ICCR
- IP830020 Issuer Cross-Border Fee
- IP755020-AA Acquirer Interchange Detail (Europe, South Africa)

### XML data file available in variable length version

The bulk types are TN66 (Production) and TN68 (Test) for outbound file delivery. These are the XML files:

- IP142110-AA - IPM Clearing Messages Created On Behalf of a Customer
- IP142520-AA - On Behalf Service Fee Collection
- IP148320-AA - Miscellaneous Override Financial Adjustments
- IP170010-AA - Acquirer-funded Reward Present Created On Behalf
- IP702010-AA - Acquirer-funded Reward Present Created On Behalf

## Chapter 9 Reconciliation

*This section describes the [Dual Message Clearing System](#) reconciliation messages and reports and how they can be used in the reconciliation process.*

| Bilateral transactions in relation to reconciliation messages.....                      | 2073 |

## Overview

Reconciliation can be a two-part process. First, for customers signed up to receive the reconciliation messages, reconciliation helps ensure that individual transactions, both received or sent, sum up to the intended summary amount as reported in the reconciliation messages.

Second, individual transactions that have been processed (or the Settlement Position Detail/ 1644-688 records) are then matched to the settlement amount that Mastercard executes to the customer, as shown of the customer's Mastercard Settlement Advisement.

The following chapter discusses reconciliation messages, reconciliation reports, and early reconciliation:

- The first section of this chapter, [Options for reconciliation of clearing and settlement data](#), defines these three categories.
- The remainder of the chapter provides further details, including relevant private data subelements (PDSs), data elements (DEs), layouts, and examples.

**NOTE: Reconciliation messages accumulate only accepted financial activity.**

## Options for reconciliation of clearing and settlement data

The Dual Message Clearing System provides several options to assist customers with reconciling their clearing and settlement data:

- Reconciliation messages provide detail and summary information of the customer's clearing and settlement financial activity totals.
- Reconciliation reports provide detail and summary information of the customer's clearing and settlement financial activity totals.
- Early Reconciliation allows customers to receive errors and acknowledgment reconciliation messages earlier than clearing cycle cutoff.
- Reconciliation Utility allows customers to submit the contents of amount fields in individual customer outgoing and incoming Integrated Product Messages (IPMs).

Each option is available for customers depending on the type of financial transaction activity received.

### Options for reconciliation

| Option                  | Clearing financial data | Clearing settlement data |
|-------------------------|-------------------------|--------------------------|
| Reconciliation Messages | Yes                     | Yes                      |
| Reconciliation Reports  | Yes                     |                          |
| Early Reconciliation    | Yes                     | Yes                      |

| Option                 | Clearing financial data | Clearing settlement data |
|------------------------|-------------------------|--------------------------|
| Reconciliation Utility | Yes                     | Yes                      |

For more information about the Reconciliation Utility, refer to the *Clearing Optimizer: Mainframe* manual.

## IPM reconciliation messages for clearing and settlement data

### Reconciliation messages generated by the Dual Message Clearing System

Reconciliation messages are optional for customers and are generated for each clearing cycle in which there is applicable transaction data.

Reconciliation messages available to customers are:

- File Currency Summary/1644-680 message
- Financial Position Detail/1644-685 message
- Settlement Position Detail/1644-688 message

The [Dual Message Clearing System](#) generates these messages as an acknowledgment message, a notification message, or both, depending on the type of data being accumulated and the options elected by the customer.

The term "Detail" in the Financial Position Detail/1644-685 title means this message provides "detail" financial information about the transactions summarized in this message. In addition, while summarized amounts in reconciliation currency are provided in this reconciliation message, PDS 0359 (Settlement Activity) containing the settlement and money movement information (Transfer Agent, Settlement Service ID, and Settlement Date) is not provided in this message.

The term "Detail" in the Settlement Position Detail/1644-688 title means this message provides "detail" settlement and money movement information about the transactions summarized in this message, including PDS 0359.

The messages include a four-position DE 25 (Message Reason Code), which identifies it as either an acknowledgment or a notification reconciliation message.

#### Values and messages

| If DE 25 contains a value of... | Then this message is a...             |
|---------------------------------|---------------------------------------|
| 6861                            | Acknowledgment Reconciliation message |

| If DE 25 contains a value of... | Then this message is a...           |
|---------------------------------|-------------------------------------|
| 6862                            | Notification Reconciliation message |

Acknowledgment is a type of [IPM](#) reconciliation message confirming the sending customer's outbound activity that the Dual Message Clearing System processed.

Notification is a type of IPM reconciliation message confirming the receiving customer's inbound activity that the Dual Message Clearing System processed.

## Financial messages considered in reconciliation

Only some of the IPM messages available for customers have a financial impact on reconciliation.

Financial activity messages that contribute to reconciliation message amount totals are:

- First Presentment/1240-200
- First Chargebacks (Full)/1442-450
- First Chargebacks (Partial)/1442-453
- Second Presentment (Full)/1240-205
- Second Presentment (Partial)/1240-282
- Arbitration Chargeback (Full)/1442-451 (Mexico RedMX scheme only)
- Arbitration Chargeback (Partial)/1442-454 (Mexico RedMx scheme only)
- Fee Collection (Retrieval Fee Billing)/1740-700, and
- Fee Collection (Other)/1740-700, 1740-780, 1740-781, 1740-782, 1740-783: all cycles

## Acknowledgment reconciliation messages created by the Dual Message Clearing System

Customers may optionally choose to receive acknowledgment reconciliation messages based on the activity received by the Dual Message Clearing System from the customer.

Acknowledgment reconciliation messages accumulate only accepted financial activity.

If Mastercard receives clearing files from the customer, the Dual Message Clearing System creates acknowledgment reconciliation messages for the financial activity included in each customer's logical files. If the files contained only non-financial activity, no acknowledgment reconciliation messages are created.

The Dual Message Clearing System provides acknowledgment reconciliation messages for files sent in by each customer based on the customer's profile options.

Acknowledgment reconciliation messages contain the Dual Message Clearing System-calculated totals for accepted financial activity sent in by each customer.

### Clearing acknowledgment messages

| If Mastercard...                                      | And the files...                                                                                                                               | Then the Dual Message Clearing System...                                                        |
|-------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------|
| Receives clearing files from the customer             | Do not contain financial clearing data (for example, if all messages between the file header and file trailer messages are retrieval requests) | Does not create acknowledgment financial and settlement reconciliation messages.                |
|                                                       | Contain financial clearing data                                                                                                                | Creates acknowledgment financial and settlement reconciliation messages for the financial data. |
| Does not receive any clearing files from the customer |                                                                                                                                                | Does not generate any acknowledgment messages.                                                  |

## Notification reconciliation messages created by the Dual Message Clearing System

The Dual Message Clearing System provides notification reconciliation messages for files sent to each customer based on the customer's profile options.

Notification reconciliation messages contain the Dual Message Clearing System-calculated totals for financial activity contained in files sent to each customer.

## Reconciliation message totals

Based on the reconciliation categories that the customer chooses, the Dual Message Clearing System includes the totals in the following private data subelements (PDSs) of the File Currency Summary/1640-680, Financial Position Detail/1644-685, or Settlement Position Detail/1644-688 messages.

Refer to the three columns to the right to determine when the private data subelements are mandatory (M) or conditional (C) within the 1644-680, 1644-685 and 1644-688 messages.

## Location of reconciliation totals

| PDS  | Will include reconciliation totals for...   | In...                                                                                                                                                                                                                                                            | Presence of this PDS in |                  |                  |
|------|---------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|------------------|------------------|
|      |                                             |                                                                                                                                                                                                                                                                  | 1644-680 message        | 1644-685 message | 1644-688 message |
| 0360 | Reconciled, Transaction Sequence Identifier | This indicates that a split has occurred in the reconciliation total reported in reconciliation messages. The subfields indicate the sequence and the total number of message splits. See the <a href="#">IPM reconciliation split</a> section for more details. | C                       | C                | C                |
| 0380 | Debits, transaction amount                  | Transaction currency                                                                                                                                                                                                                                             | M                       | C                | N/A              |

|      |                                           |                                                                                                         | 1644-680 message        | 1644-685 message | 1644-688 message |
| 0402 | Total, transaction number                 | This is a record count of all bilateral, and Global Collection Only transactions settled by Mastercard. | M                       | M                | N/A              |

**NOTE:** The term "transaction amount" refers to DE 4 (Amount, Transaction) or DE 5 (Amount, Reconciliation), depending on the currency type indicated. The term "fee amounts" refers to PDS 0146 (Amounts, Transaction Fee). The term "Transaction currency" refers to DE 49 (Currency Code, Transaction). The term "Reconciliation currency" refers to DE 50 (Currency Code, Reconciliation).

## List of optional reconciliation categories

Customers may select or change these reconciliation categories by contacting their account manager or Mastercard Customer Implementation Specialist.

These definitions are used in the Types of reconciliation message categories table:

- Transactions cleared and settled by Mastercard: Financial activity from customer to customer, from customer to Mastercard, and from Mastercard to customer for which the Mastercard settlement system completes settlement.
- Bilateral transactions: Transactions submitted for clearing that Mastercard does not settle because customers settle them through an interface outside of the Mastercard settlement system. These transactions are reported only in transaction currency; they are not reported in reconciliation currency, because they are not settled through Mastercard.
- Global Collection Only transactions: On-Us or intraprocessor transactions that customers cleared and settled outside of the Mastercard Dual Message Clearing System. Customers send these transactions to the Dual Message Clearing System for reporting purposes only (Customers never receive notification reconciliation messages with Global Collection Only totals because the Dual Message Clearing System does not forward the Global Collection Only messages; therefore, only acknowledgment reconciliation messages are created). These transactions are reported only in transaction currency; they are not reported in reconciliation currency, because they are not settled through Mastercard.
- In addition, full business service selection does not occur on Global Collection Only. Therefore, the Global Collection Only transactions are reported within the lowest level card program identifier, business service type, and business service ID in common for both customers.

Customers that want to receive reconciliation totals for Mastercard settled, bilateral settlement, and Global Collection Only activity should request both the transaction currency option and the settlement indicator option for Financial Position Detail/1644-685 reconciliation messages to differentiate amount totals for each of these types of transactions.

**NOTE:** These values in the following table indicate the presence of each type of reconciliation message in the Financial Position Detail/1644-685 and Settlement Position Detail/1644-688 messages:

- **D - Default:** If the customer elects to receive reconciliation messages, this category is provided automatically.
- **O - Optional:** The category is not required but may be included at the customer's option.
- **R - Recommended:** Unless the customer specifies otherwise, this category is provided.

## Types of reconciliation message categories

| Reconciliation<br>Message<br>Category  | Provides Totals of<br>Reconciliation<br>Amounts by: | Additional Information about this<br>Reconciliation Category                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Available for:          |     |                         |

| 1 PDS 0300<br>(Reconciled, File<br>ID) | PDS 0105 (Sending<br>File ID)                       | <p>The file originator must create a unique File ID for each File Header/1644-697 message in and across transmissions. The file originator accomplishes this by using unique values in the file ID in each File Header/1644-697 message and corresponding File Trailer/1644-695 message. This value appears in PDS 0300 of the reconciliation message.</p> <p>The value provided in the customer acknowledgment messages identifies the file ID in PDS 0105 submitted by the customer.</p> <p><b>NOTE: Customers sending a full file reversal using the same file ID, within the same clearing, may receive reconciliation messages with amount totals that net to zero as a result of the original file and the reversal file processing in the same clearing.</b></p> <p>The value provided in the customer notification messages identifies the clearing cycle and the delivery cycle within the file ID in PDS 0105 sent to the customer.</p> <p>These values can be used for reconciliation to the Settlement Advisement totals.</p> | R                       | R   | D                       |

| 12 | PDS 0367 (Reconciled Card Program Identifier)         | Card Program Identifier                                         | Customers that select this as a settlement reconciliation option receive totals based on the contents of PDS 0367 in the Acknowledgment Settlement Position/1644 message. The Dual Message Clearing System populates PDS 0367 based on PDS 0158 (Business Activity), subfield 1 (Card Program Identifier).                                                                                                                                                                                                                                                                                                                                                          | N/A                  | N/A | O                    |
| 13 | PDS 0368 (Reconciled Transaction Function Group Code) | Totals are provided for each unique Transaction Function group. | Customers that select this as a settlement reconciliation option receive totals based on the contents of PDS 0368 in the Acknowledgment Settlement Position/1644 message.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | N/A                  | N/A | O                    |
| 14 | PDS 0369 (Reconciled Acquirer Reference ID)           | Acquirer Reference ID                                           | <p>Customers may receive amount totals only for their own Acquirer Reference ID as established by Mastercard.</p> <p>Customers that select this as a settlement reconciliation category receive complete reconciliation information for their:</p> <ul style="list-style-type: none"> <li>• Acquirer Reference ID</li> <li>• Issuing activity (at the customer ID level), and</li> <li>• Fee collection activity (at the customer ID level)</li> </ul> <p>When this category is selected, the acquirer receives messages for each Acquirer Reference ID range established for its customer ID that had activity in the applicable file, clearing file, or both.</p> | N/A                  | N/A | O                    |

**NOTE:** Although these transactions are traditionally considered to be non-financial with respect to the processing code, they may be classified as financial transactions when they are originated containing an access fee collected by the ATM provider.

Account range reconciliation category

The initial population of account ranges uses the customer's issuer account range.

Account range building

|                                                                                                                                                         |
|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Global Clearing Management System, Clearing Optimizer, and IPM MPE will construct Customer ID and issuer account range as:</b>                       |
| Customer ID 009999 or 00000009999                                                                                                                       |
| <b>NOTE: The IPM MPE contains the 11-position representation. The IPM format supports a variable representation from six positions to 11 positions.</b> |
| Account Range Low 555555000000000000 (zero-filled)                                                                                                      |
| Account Range High 5555559999999999999 (nine-filled) (issuer only or both)                                                                              |

The account ranges initially allow specification by 11-position ranges; however, this field supports 19 positions for future use. The positions 12-19 in the Issuing Account Range reconciliation category element are zero-filled for the beginning account range and nine-filled for the ending account range.

Transaction function reconciliation category

The transaction functions currently supported for reconciliation messages are listed in the Currently Supported Transaction Functions table.

**NOTE:** If the customer chooses to receive reconciliation messages for transaction functions, Mastercard provides reconciliation detail only for the transaction functions for which financial detail activity has occurred.

Currently supported transaction functions

| Message Type Identifier | Function Code | Transaction Function      |
|-------------------------|---------------|---------------------------|
| 1240                    | 200           | First Presentment         |
| 1240                    | 205           | Second Presentment (full) |

| Message Type Identifier                                                                                                                                                              | Function Code | Transaction Function                                                                                              |

## Customer Reconciliation Indicator 1 reconciliation category

The Customer Reconciliation Indicator 1 table provides details about PDS 0375.

### Customer Reconciliation Indicator 1

| IF the customer chooses the reconciliation category... | THEN...                                                                                                 |
|--------------------------------------------------------|---------------------------------------------------------------------------------------------------------|
| Customer Reconciliation Indicator 1                    | 1. For each of the proprietary values present in clearing activity that includes the optional PDS 0375. |

| IF the customer chooses the reconciliation category... | THEN...                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|--------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                        | <p>Example: A customer includes the value 1234 in PDS 0375 for several First Presentment messages and 5678 in PDS 0375 for several other First Presentment messages. In this case, the IPM reconciliation messages include totals of the clearing activity for all of the messages that have the value 1234 in PDS 0375 and separate totals for all the messages that have the value 5678 in PDS 0375.</p>                                                                                                                                                                                                                                                          |
| 2.                                                     | <p>For all financial activity when PDS 0375 is not provided.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|                                                        | <p>Example: A customer has chosen this reconciliation category but does not include PDS 0375 in several of the First Presentment clearing messages submitted. The Dual Message Clearing System creates an acknowledgment message with a Customer Reconciliation Indicator 1 value of undefined. This process ensures that the acknowledgment reconciliation provided represents 100 percent of the accepted financial activity of the customer for that file.</p>                                                                                                                                                                                                   |
| 3.                                                     | <p>Will not receive reconciliation totals based on PDS 0375 (Member Reconciliation Indicator 1) for reporting within any business service arrangement subject to the Extended Decimal Precision service, as the decimal portion of the interchange is not settled at the individual transaction level. For customers using this Financial Reconciliation Option, the totals within a business service arrangement subject to the Extended Decimal Precision Service are accumulated and returned in acknowledgment reconciliation messages where PDS 0375 contains the value undefined. Use of PDS 0375 in other business service arrangements is not affected.</p> |

## Functionality in the reconciliation messages

The reconciliation messages provide customers with detailed reconciliation data in reconciliation currency and, optionally, transaction currency. Customers do not receive totals in U.S. dollars unless the transaction currency or reconciliation currency is U.S. dollars.

- The File Currency Summary/1644-680 message always contains totals in transaction currency.
- The Financial Position Detail/1644-685 message always contains totals in the customer's reconciliation currency.

### Functionality in the reconciliation messages

| For...                              | Dual Message Clearing System provides amount totals in...                                             |
|-------------------------------------|-------------------------------------------------------------------------------------------------------|
| Global Collection Only transactions | Transaction currency only.                                                                            |
| Bilateral transactions              | Transaction currency only.                                                                            |
| All other transactions              | The customer's reconciliation currency and, if the customer selects it, also in transaction currency. |

When the reconciliation amounts are for bilateral totals, Global Collection Only totals, or both, the message elements related to reconciliation currency amounts are present in the reconciliation message, but zero-filled. However, elements related to transaction counts always contain totals for those settled by Mastercard, bilateral, and Global Collection Only count when there is activity for those transaction types.

The IPM format does not require customers to provide expected reconciliation totals. Customers may optionally provide hash totals for counts and amounts in PDS 0301 and PDS 0306 in their outbound File Trailer/1644-695 messages to activate file integrity checks. However, the Dual Message Clearing System does not use this data in PDS 0301 and PDS 0306 as part of the reconciliation process.

Reconciliation messages accumulate only accepted financial activity. Financial activity currently includes the transaction functions shown in the table Currently Supported Transaction Functions. The reconciliation messages report only accepted (not rejected) transaction message totals.

**NOTE: For more information about transaction functions, as identified by MTI and Function Code (DE 24), that qualify as financial activity, refer to [DE 24 \(Function Code\)](#).**

## File Currency Summary/1644-680 message

This message provides a summary by transaction currency of the customer's clearing financial activity totals. Customers that choose to receive this type of message receive one message for each transaction currency that occurs, by logical file.

File Currency Summary/1644-680 messages may be provided as acknowledgment messages (to reconcile a customer's previously submitted outgoing clearing file), notification messages (to reconcile a customer's incoming clearing file), or both.

Both credit and debit totals are provided by transaction currency. The Dual Message Clearing System determines the original amount and identifies it as a credit or a debit through the processing code. The Dual Message Clearing System then calculates the credit and debit sums for a given currency and places those sums in the appropriate amount elements in the File Currency Summary message.

For a layout and details of the data elements and private data subelements included in the File Currency Summary/1644-680 message, see [General message layout information](#).

## Financial Position Detail/1644-685 message

Customers may choose to receive the Financial Position Detail message. The Dual Message Clearing System generates this message for both acknowledgment and notification activity. Customers electing to receive these messages receive both types in the next T112 clearing file after each clearing cycle cutoff.

Customers submitting clearing files to the Dual Message Clearing System that have also selected the T113 Early Reconciliation file option receive acknowledgment Financial Position Detail/1644-685 messages after the Dual Message Clearing System completes the processing of the physical file. These totals are not repeated in the T112 clearing file after the clearing cycle cutoff.

The Financial Position Detail/1644-685 message provides details of the customer's clearing financial activity by reconciliation categories.

There are multiple reconciliation categories, and all are optional. Customers may select up to:

- Nine categories for reconciliation messages reflecting customer inbound data (referred to as Notification data)
- Ten categories for reconciliation messages reflecting customer outbound data (referred to as Acknowledgment data)

The Dual Message Clearing System automatically provides all message amount totals for the Financial Position Detail/1644-685 in the customer's reconciliation currency. If a customer selects the Transaction Currency reconciliation category, the message contains amount totals for each unique pair of transaction currency and reconciliation currency for which there was clearing activity.

For a layout and details of the data elements and private data subelements included in the Financial Position Detail/1644-685 message, see [General message layout information](#).

## Choosing clearing reconciliation categories

For clearing reconciliation messages, customers may choose reconciliation categories separately for acknowledgment messages and notification messages.

Customers that want to receive reconciliation totals for Mastercard settled, bilateral settlement, and global collection only activity should request both the transaction currency option and the settlement indicator option for Financial Position Detail/1644-685 reconciliation messages to differentiate amount totals for each of these types of transactions.

Customers may select category options by contacting their account manager or Mastercard Customer Implementation Specialist.

The Dual Message Clearing System generates a Financial Position Detail/1644-685 message for each unique combination of values for the selected reconciliation categories. For example, a

customer could select the reconciliation categories for acknowledgment and notification messages as shown in the following table titled Example of Customer Reconciliation Messages.

**Example of customer reconciliation messages**

| Acknowledgment or Notification | Reconciliation Category                                                                                                                                                                                                                                              |
|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Notification                   | Customer Activity                                                                                                                                                                                                                                                    |
|                                | Account Range:<br>54XXXXXXXXXXXXXXXXXX - 54XXXXXXXXXXXXXXXXXX                                                                                                                                                                                                        |
| Notification                   | <b>NOTE: Initially, account ranges will allow specification by 11-position ranges; however, this field supports 19 positions for future use. Refer to the previous table titled Account Range Building for additional information about building account ranges.</b> |
| Notification                   | Settlement Indicator (values B, C, and M)                                                                                                                                                                                                                            |
| Notification                   | Original/Reversal Transactions                                                                                                                                                                                                                                       |
| Notification                   | Processing Code                                                                                                                                                                                                                                                      |
| Acknowledgment                 | Customer Activity                                                                                                                                                                                                                                                    |
| Acknowledgment                 | File ID                                                                                                                                                                                                                                                              |
| Acknowledgment                 | Settlement Indicator (values B, C, and M)                                                                                                                                                                                                                            |
| Acknowledgment                 | Original/Reversal Transactions                                                                                                                                                                                                                                       |
| Acknowledgment                 | Processing Code                                                                                                                                                                                                                                                      |

For each combination of category, the Dual Message Clearing System generates a unique notification or acknowledgment Financial Position Detail/1644-685 message. For example, one Financial Position Detail/1644-685 reconciliation message would contain totals for the combination of one account range plus settlement indicator, another for a second account range plus settlement indicator, and so forth.

Within the reconciliation categories for account range, customer activity, settlement indicator, and processing code are multiple possible values. This can result in additional reconciliation category combinations, generating additional Financial Position Detail/1644-685 messages. This applies to all reconciliation categories.

For example, suppose that customer 001234 has selected the following reconciliation categories for acknowledgment and notification messages and has clearing data as shown.

### Reconciliation categories for acknowledgment or notification messages

| Acknowledgment or Notification | Reconciliation Category Selected                  | Clearing Data Received/Sent                                                         |
|--------------------------------|---------------------------------------------------|-------------------------------------------------------------------------------------|
| Notification                   | Business Activity                                 | MCC and DMC<br>U.S.-U.S.<br>IRDs:<br>70 (Merit III) for MCC<br>78 (Merit I) for DMC |
| Notification                   | Settlement Indicator (values B, C, and M)         | M (Mastercard Settled): both MCC and DMC                                            |
| Notification                   | Original/Reversal Transactions                    | O (original): MCC<br>R (reversal): DMC                                              |
| Notification                   | Processing Code (for example, purchase or unique) | Purchase: both MCC and DMC, USD 100 each                                            |
| Acknowledgment                 | File ID                                           | 00205290300123400001                                                                |
| Acknowledgment                 | Settlement Indicator (values B, C, and M)         | M (Mastercard Settled): both MCC and DMC                                            |
| Acknowledgment                 | Original/Reversal Transactions                    | O (original): both MCC and DMC                                                      |
| Acknowledgment                 | Processing Code (such as purchase and unique)     | Purchase: both MCC and DMC, USD 50 each<br>Unique: MCC, USD 25                      |

For each combination of categories, the Dual Message Clearing System generates a unique notification or acknowledgment Financial Position Detail/1644-685 message.

In addition, within the reconciliation categories for business activity, settlement indicator, original/reversal, and processing code are multiple possible values. These values can result in additional reconciliation category combinations, generating additional Financial Position Detail/1644-685 messages.

Using the selected reconciliation categories and specified values shown in the previous table, Dual Message Clearing System generates the following Financial Position Detail/1644-685 messages.

### Acknowledgment or notifications received

| Acknowledgment or Notification Received | Clearing Data Totals Reported                                                       |
|-----------------------------------------|-------------------------------------------------------------------------------------|
| Notification Message 1                  | USD 100: <b>credit, IRD 70</b> , Mastercard settled, original, purchase transaction |
| Notification Message 2                  | USD 100: <b>debit, IRD 78</b> , Mastercard settled, reversal, purchase transaction  |
| Acknowledgment Message 1                | USD 100: file ID, Mastercard settled, original, purchase transactions               |
| Acknowledgment Message 2                | USD 25: file ID, Mastercard settled, original, unique transaction                   |

In this example, when the customer does not select the business activity reconciliation category, the Dual Message Clearing System combines the reconciliation totals for consumer credit transactions and point-of-sale (POS) consumer debit transactions. The Dual Message Clearing System also combines the interchange fee amount totals for those transactions. Conversely, when the business activity reconciliation category is selected, the Dual Message Clearing System specifies the interchange fee amount totals with the associated credit or POS debit transaction amount totals in the reconciliation messages.

Customers may receive IPM acknowledgment and notification reconciliation messages for POS debit and credit activity within the same logical file. Customers selecting the Early Reconciliation file option may also see acknowledgment messages for both POS debit and credit activity in the same Early Reconciliation file from the Dual Message Clearing System.

## Settlement Position Detail/1644-688 message

Customers may choose to receive the Settlement Position Detail/1644-688 message. The Dual Message Clearing System generates this message for both acknowledgment and notification activity. Customers electing to receive these messages receive them after each clearing cycle cutoff.

The Settlement Position Detail/1644-688 message provides details of the customer's settlement financial activity by reconciliation categories giving the customer the ability to reconcile settlement positions and tie back to the Settlement Advisement received from the Mastercard [S.A.M.](#) system.

There are multiple settlement reconciliation categories. If a customer chooses to receive Settlement Position Detail/1644-688 messages, the two default categories of PDS 0300 (Reconciled, File ID) and PDS 0359 (Reconciled, Settlement Activity) must be selected. In addition to the default categories, customers may select up to five optional categories for reconciliation messages reflecting customer inbound notification and outbound acknowledgment data.

The Dual Message Clearing System provides all message amount totals for the Settlement Position Detail/1644-688 in the customer's reconciliation currency. If a customer selects the Transaction Currency reconciliation category, the message contains reconciliation amount totals for each unique pair of transaction currency and reconciliation currency for which there was settlement activity.

If the customer chooses this message option, a Settlement Position Detail message is generated only for transactions settled by Mastercard (PDS 0165 = M) after each clearing cycle.

For the layout and details of the data elements and private data subelements included in the Settlement Position Detail/1644-688, see [General message layout information](#).

**NOTE: The Settlement Position Detail/1644-688 Message is delivered along with the customers' normal activity at the end of each clearing cycle (Bulk Type T112) and included in the IPM Early Reconciliation File (Bulk Type T113) if the customer has requested it.**

### Choosing settlement reconciliation categories

For settlement reconciliation messages, customers choose reconciliation categories that apply to both acknowledgment messages and notification messages.

The Dual Message Clearing System generates a Settlement Position Detail/1644-688 message for each unique combination of values for the selected reconciliation categories. For example, a customer could select the reconciliation categories for messages as shown in the following table.

#### Example of customer settlement reconciliation messages

| Reconciliation Category                                                                                                                                                                                                                                              |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Account Range:<br>54XXXXXXXXXXXXXXXXXX - 54XXXXXXXXXXXXXXXXXX                                                                                                                                                                                                        |
| <b>NOTE: Initially, account ranges will allow specification by 11-position ranges; however, this field supports 19 positions for future use. Refer to the previous table titled Account Range Building for additional information about building account ranges.</b> |
| Reconciled, File (PDS 0300) default category                                                                                                                                                                                                                         |
| Reconciled, Settlement Activity (PDS 0359) default category                                                                                                                                                                                                          |

For each combination of categories, the Dual Message Clearing System generates a unique notification or acknowledgment Settlement Position Detail/1644-688 message. For example, one Settlement Position Detail/1644-688 reconciliation message would contain totals for the combination of one account range, one file ID, and settlement activity, another for a second account range, file ID, and settlement activity, and so forth.

Customers may receive IPM acknowledgment and notification settlement reconciliation messages for point-of-sale (POS) debit and credit activity within the same logical file.

## Dual Message Clearing System reconciliation reports

The Dual Message Clearing System reports supplement the reconciliation messages and facilitate customers' internal reconciliation and balancing related to Mastercard.

Customers can request these reports in print image format. The print image format is a standard 133-character print format that contains a one-position carriage control.

Customers can use the reports for both financial data reporting and for customer statistical data capture for analysis within customer management information systems (MIS).

The Dual Message Clearing System separates the clearing reports for accepted transactions by acknowledgment and notification clearing data. The Dual Message Clearing System generates these reports upon completion of the applicable clearing cycle. Once these reports are generated, the Dual Message Clearing System sends them to the customers that have requested them. These reports are optional.

Customers requesting the reports receive them for each clearing cycle. The Dual Message Clearing System transmits these reports using bulk types:

- T140: Clearing Cycle Acknowledgment Report (production)
- T150: Clearing Cycle Acknowledgment Report (test)
- T140: Clearing Cycle Notification Report (production)
- T150: Clearing Cycle Notification Report (test)

**NOTE: Customers that request these reports receive them after each clearing cycle.**

Although reconciliation messages may vary depending on customer reconciliation category selections, the reports do not vary and always provide totals for all 11 of the reconciliation categories shown in the following table.

Customers have the option to receive Dual Message Clearing System reconciliation reports for accepted clearing data and rejected clearing data.

### Reconciliation report categories

|   | Category                                   | Examples of Items in the Category                                               |
|---|--------------------------------------------|---------------------------------------------------------------------------------|
| 1 | Card Program Identifier (Acceptance Brand) | Mastercard, private label.                                                      |
| 2 | Business Service Level                     | Customer-to-customer, intracountry, intercountry, intraregional, interregional. |
| 3 | Business Service ID                        | Business Service ID number.                                                     |

| Category |                                          | Examples of Items in the Category                                                                                                                                                                    |
|----------|------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 4        | Interchange Rate Designator              | The ID assigned to the specific interchange program within the business agreement identified.                                                                                                        |
| 5        | Transaction Function                     | First presentment, first chargeback, second presentment.                                                                                                                                             |
| 6        | Processing Code                          | Purchase, ATM, Unique, Payment Transaction.                                                                                                                                                          |
| 7        | Original/Reversal Transactions           | Original transactions separated from reversal transactions.                                                                                                                                          |
| 8        | Settlement Indicator                     | Settled by Mastercard, Bilateral, Global Collection Only.                                                                                                                                            |
| 9        | Reconciliation Currency/Code             | Reconciliation Currency alpha and numeric codes. These totals reflect only Mastercard settled transactions. Bilateral and Global Collection Only totals are not provided in reconciliation currency. |
| 10       | Financial and Non-Financial Transactions | Financial transactions separated from non-financial transactions.<br><b>NOTE: Non-financial transactions include retrieval requests and financial detail addenda.</b>                                |
| 11       | Logical File ID                          | Customer outbound logical file ID or customer inbound logical file ID.                                                                                                                               |

The reconciliation reports are available for distribution to the customers upon request. Customers can contact the Global Customer Service team or their regional office to request these reports, detailed in the Dual Message Clearing System Reconciliation Reports table and in the report samples that follow.

If the customer chooses the option to receive reconciliation reports, detail IPM clearing reports and a summary report are generated for each of the six clearing cycles. These reports supplement the IPM reconciliation messages and facilitate reconciliation and balancing for the customers.

A seventh clearing cycle exists exclusively for Mexico domestic switching transactions. For more information on the seven clearing cycles, refer to the Daily Clearing Cycle Schedule section.

## Accumulating reconciliation totals

Details about how to accumulate reconciliation messages for customers and processors receiving reconciliation messages by different categories are described here.

**NOTE: Customers and processors need to accumulate reconciliation messages to derive a grand total, by processor, for any of the reconciliation categories for the customers for which they process.**

For example, suppose that customer or processor 001111 processes for Customer ID 002222, Customer ID 003333, and Customer ID 004444 and that Mastercard has set up the customers' selected categories for notification messages in this way.

- Customer ID 002222: Set up to receive reconciliation totals by processing code and settlement indicator.
- Customer ID 004444: Set up to receive reconciliation totals by processing code and settlement indicator.

Although it is unlikely that a customer or processor would establish such a diverse set of categories for each Customer ID, this example illustrates the process for accumulating any set of reconciliation totals.

### Reconciliation totals

| Member ID                                                            | Processor<br>001111 Receives<br>Record... | Processing Code      | Settlement<br>Indicator  | Originals/<br>Reversals | Transaction<br>Function |

|                                                                      | 10                                        | ATM: USD 50.00       | Settled by<br>Mastercard |                         |                         |
| Subtotal of ATM Processing Code<br>for Customer ID 4444              |                                           | USD 50.00            |                          |                         |                         |
| Grand Total of Purchase<br>Processing Code for Customer ID<br>001111 |                                           | USD 200.00           |                          |                         |                         |

To derive a total at the customer or processor level for any of the above reconciliation categories, the customer or processor needs to accumulate and total each applicable Customer ID's reconciliation category.

For example, to derive the notification totals by processing code of purchase for processor 001111, the processor must accumulate the notification totals by processing code of purchase for Customer ID 002222 and Customer ID 004444.

**NOTE: All summarization of totals occurs within the same currency.**

## Early Reconciliation Service Overview

Early Reconciliation Service helps customers sending files to Mastercard to expedite their clearing reconciliation process.

It provides an early acknowledgment summary of clearing transactions submitted to the Dual Message Clearing System and error messages. This service can provide balancing information, error records, and can help customers and processors make their merchant pre-funding decisions without waiting for the next Dual Message Clearing System cutoff and distribution of notification data.

It allows the customer to understand its settlement position for the file processed by Mastercard and to correct and resubmit any errors that may be present without the constraint of waiting for the next Dual Message Clearing System cutoff time.

As part of the Early Reconciliation Service customers can receive the Early Reconciliation file after the Dual Message Clearing System has processed their outbound IPM logical clearing files, without waiting until the clearing cutoff time to receive their reconciliation messages. This option is available at the processor level. If a customer is its own processor, the customer may also choose this option for itself.

The Early Reconciliation File (T113) provides:

- File Currency Summary/1644-680 message
- Financial Position Detail/1644-685 message
- Dual Message Clearing System rejects - Message Exception/1644-691 and File Reject/1644-699 messages

Customers also can optionally receive Settlement Position Detail/1644-688 messages in their Early Reconciliation file. If the customer has chosen to receive the File Currency Summary/1644-680 message, Financial Position Detail/1644-685 message, and Settlement Position Detail/1644-680 message, the Early Reconciliation file includes all these messages. All message formats are the same as the reconciliation messages sent in the customer inbound clearing file at cycle cutoff (Bulk Type T112).

Acquirers and issuers sending files to Mastercard can only select an acknowledgment message for their Early Reconciliation Service that has been selected for their reconciliation messages. For example, if a customer or processor has not chosen to receive the Settlement Position Detail/1644-688 message for their reconciliation messages, they cannot choose to receive Settlement Position Detail/1644-688 in their Early Reconciliation file.

**NOTE: The Dual Message Clearing System does not duplicate the messages provided in the Early Reconciliation files when it creates the customer inbound clearing files at cycle cutoff times. The customer receives the messages only once. The Early Reconciliation file is transmitted using bulk type T113. This differs from the normal clearing cycle cutoff file bulk types, to clearly distinguish the Early Reconciliation file from all other clearing files. Reconciliation messages not selected in Early Reconciliation are delivered within the customers inbound file from Mastercard (T112) based on customer selection.**

**NOTE: Refer to [Financial Position Detail/1644-685 message](#) to learn more about the various default, optional, and recommended reconciliation categories by which customers can receive Financial Position Detail/1644-685 message and Settlement Position Detail/1644-688 message.**

## Early Reconciliation Service Enrollment

Customers may enroll in the Early Reconciliation Service by contacting their account manager or Mastercard customer implementation specialist (CIS).

## IPM reconciliation split

PDS 0360 (Reconciled, Transaction Sequence Identifier) indicates that there has been a split in the reconciliation total amount reported in reconciliation messages. The subfields indicate the sequence and the total number of message splits.

For example: The Dual Message Clearing System calculates a reconciliation amount of 19,999,999,999,999,999 (17 digits or more). Then the Dual Message Clearing System splits that single reconciliation amount into multiple amounts (in this case, specifically three amounts) and includes each amount in three separate 1644-680/1644-685/1644-688 reconciliation messages. The sum total of those three amounts equals the total reconciliation amount.

Additionally, to simplify customer reconciliation processing, the Dual Message Clearing System inserts a new PDS 0360 into each of those reconciliation messages to provide the sequence number of each related message and the total number of messages pertaining to given split amount.

1. PDS 0360 subfield 1 = 00001, PDS 0360 subfield 2 = 00003 and Amount-PDSs\* = 9999999999999999 (16 positions)
2. PDS 0360 subfield 1 = 00002, PDS 0360 subfield 2 = 00003 and Amount-PDSs\* = 9999999999999999 (16 positions)
3. PDS 0360 subfield 1 = 00002, PDS 0360 subfield 2 = 00003 and Amount-PDSs\* = 9999999999999999 (16 positions)

The total reconciliation amount can then be calculated as: 9,999,999,999,999,999 + 9,999,999,999,999,999 + 0000000000000001 = 19,999,999,999,999,999.

All of the related 1644-680/1644-685/1644-688 messages for a given split are always sent in the proper order and always sent together sequentially. Mastercard never intermixes 1644-680/1644-685/1644-688 messages from unrelated splits, nor does Mastercard ever separate the messages belonging to a split with a single message that is not related to any split whatsoever.

**\*Amount-PDS:** Indicates amount PDS which are applicable for split like 0380/0381/0384/0390/0391/0392/0393/0394/0395/0396 for 1644 transactions. Customers should check for the presence of PDSs for different transactions in the table.

## Bilateral transactions in relation to reconciliation messages

Financial Position Detail/1644-685 reconciliation messages provide amount and fee totals in each customer's reconciliation currency. These totals are also optionally available in transaction currency.

Because Mastercard does not settle transactions processed pursuant to a bilateral agreement between two customers, Financial Position Detail/1644-685 reconciliation message totals for these transactions in the customer's reconciliation currency contain zeros. If the customer has requested the transaction currency option for reconciliation messages, Financial Position Detail/1644-685 reconciliation message totals for these transactions in the transaction currency are present and contain the correct (non-zero) amounts.

Customers that want to receive reconciliation totals for bilateral settlement activity should request both the transaction currency option and the settlement indicator option for Financial Position Detail/1644-685 reconciliation messages to differentiate amount totals for these transactions.

## Appendix A Message Data Elements Used by the Dual Message Clearing System

This table lists all data elements (DEs) implemented within the ISO 8583:1993 message standard that are used by the Dual Message Clearing System in numeric order.

### Data elements currently used

Some of the products in this chapter are optional. Mastercard does not require acquirers or issuers to enroll in these optional products and services unless Participation Requirements state otherwise. Acquirers and issuers must code their systems to support these fields to leverage such product and services in a timely manner in the event of a security issue.

## Account Level Management

Mastercard Account Level Management is a platform that enables specialized processing so that Mastercard can manage capabilities at the individual card account level.

Mastercard Account Level Management provides issuers the flexibility of qualifying cardholder accounts for competitive interchange as well as upgrading cardholder accounts to different products.

The following are the key capabilities of Account Level Management functionality:

- Enhanced Value
- Product Graduation Plus
- Product Graduation Select
- High Value
- Spend Shortfall (World Mastercard and World Elite Mastercard)
- Small Business Spend Processing

For more information, refer to the *Account Level Management Manual*.

## Mastercard ATM Cash Pick-Up service

The Mastercard ATM Cash Pick-Up service allows money to be sent to individual recipients who obtain their funds from an ATM that has been upgraded with the ATM Cash Pick-Up software.

Recipients receive a code (for example, Short Message Service [SMS] text message), which they enter into the ATM; therefore, they do not need a debit card or relationship with a bank to receive funds.

The Mastercard ATM Cash Pick-Up Service provides multiple use cases for customers engaging in the service, including:

- Relief Fund Disbursement
- Emergency Cash Assistance
- Cash Rewards
- Person-to-person Payments
- Small Insurance Claims
- Government Aid Payments/Social Benefits
- Compensation

Refer to the *Mastercard Cash Pick-up Program Guide* for more information.

## Clearing Chip Processing service

This section describes the optional Clearing Chip Processing service for issuers that choose the Chip to Magnetic Stripe Conversion service.

### Clearing Chip Processing service overview

Mastercard provides a Clearing Chip Processing service to assist issuers that want to migrate to Mastercard chip technology while minimizing the impact and cost of upgrading their host systems and operations. This On-behalf Service allows issuers to take advantage of the latest chip technology.

Chip to Magnetic Stripe Conversion Service is offered in both the Dual Message Clearing and Dual Message Authorization Systems. Clearing and Authorization System On-behalf Services are optional for issuers. Customers must request Clearing and Authorization System On-behalf Services individually.

### Chip to Magnetic Stripe Conversion

The Chip to Magnetic Stripe Conversion service removes chip-related data in DE 55 (Integrated Circuit Card [ICC] System-related Data) if it is present when DE 14 (Date Expiration) is greater than or equal to the floor expiration date.

The issuer receives the First Presentment/1240–200 message containing PDS 0071 (Chip to Magnetic Stripe Conversion Indicator), subfield 1 (On-behalf Service) with a value of 01, indicating chip to Magnetic Stripe Conversion, and subfield 2 (On-behalf [OB] Result 1) with a value of C, S, or M (based on value in DE 22 [Point of Service [POS] Entry Mode]), subfield 07 [Card Data, Input Mode]) indicating that the conversion of the chip transaction to a magnetic stripe transaction has been completed.

### Magnetic Stripe Conversion service.

The following lists the actions for the chip to Magnetic Stripe Conversion service.

| If Chip to Magnetic Stripe Conversion is Y for clearing issuer account range... | Then the Dual Message Clearing System will... |
|---------------------------------------------------------------------------------|-----------------------------------------------|
| DE 55                                                                           | Remove DE 55                                  |
| <b>PDS 0071 (Chip to Magnetic Stripe Conversion Indicator)</b>                  | <b>Will contain</b>                           |
| Subfield 1 (On-behalf Service)                                                  | 01 = Chip to Magnetic Stripe Conversion       |

|                                |                                                                                                                                                                                                                                                                                                                        |

**NOTE: The Chip to Magnetic Stripe Conversion service affects issuers only. This service does not affect acquirers .**

The Chip to Magnetic Stripe Conversion service is optional for issuers.

Issuers must contact their regional Mastercard representative to request this service and identify the account range that the Chip to Magnetic Stripe Conversion service will support.

## Collection-only transaction reporting

This section describes collection-only transactions and the Global Collection Only (GCO) Data Collection Program.

### Collection-only transactions

A collection-only transaction is a transaction that is reported to Mastercard through the Dual Message Clearing System, but which has not been cleared or settled through the Mastercard Network. A customer must identify each collection-only transaction by populating PDS 0165 (Settlement Indicator), subfield 1 (Settlement Indicator), value C (Collection Only). Any new customer processing infrastructure that generates and sends collection only messages on the Mastercard Network must provide separate files for GCO and Dual Message Clearing System financial activity.

## Global Collection Only Program

### Overview

To ensure compliance with the Global Collection Only (GCO) Program, a Mastercard customer must submit all purchase, purchase with cash back, unique/quasi-cash, ATM cash withdrawal, manual cash disbursement, payment transaction, and refund/credit transactions to Mastercard as collection only if:

- The transaction was initialized with a card or account issued under a Mastercard-assigned BIN and bearing any one or more of the Mastercard brands (including Mastercard, Debit Mastercard, Maestro, or Cirrus).
- The transaction was not switched on the Mastercard Network.

For the purposes of this program, switched on the Mastercard Network means the submission of a financial transaction message to the Single Message System or the Dual Message Clearing System in request for the settlement of an outstanding debit or credit position in connection with an original completed transaction.

Refer to the *Global Collection Only Program Handbook* for more information.

### **Collection-only transactions that are not permitted for Global Collection Only**

GCO reporting is only required for first presentment transactions. No GCO data should be sent for fee collection messages.

### **Reversing Collection-only data**

A customer should reverse collection-only data if:

- The previously submitted collection-only data was duplicated (same messages sent twice)
- The previously submitted collection-only data was incorrect

**NOTE: For instructions on reversing a single message or an entire file (applicable to both collection-only and non-collection-only activity), refer to [Reversals](#).**

### **Editing Collection-only data**

The Dual Message Clearing System automatically excludes collection-only transactions from most interchange qualification edits.

For example, the Dual Message Clearing System excludes collection-only First Presentment/1240 transactions from authorization code, interchange timeliness, and industry-related addendum requirements.

### **Reporting GCO Program rejects**

The Dual Message Clearing System generates Message Exception/1644 or File Reject/1644 messages for all rejected messages and files. Within these error messages, collection only activity is designated by a value of C in PDS 0165 (Settlement Indicator), subfield 1 (Settlement Indicator).

The Dual Message Clearing System reports rejected GCO Program data through the Global Collection Only Error Detail Report (IP857010-BB).

## Collection-only activity in relation to reconciliation messages

IPM Financial Position Detail Reconciliation messages provide amount and fee totals in each customer's reconciliation currency. These totals are also optionally available in transaction currency.

Because Mastercard does not clear or settle collection-only transactions, IPM Financial Position Detail Reconciliation message totals for these transactions in the customer's reconciliation currency will contain zeros. If the customer has requested the "transaction currency" option for reconciliation messages, IPM Financial Position Detail Reconciliation message totals for these transactions in the transaction currency will be present and will contain the correct (non-zero) amounts.

Customers that want to receive reconciliation totals for collection-only activity should request both the transaction currency option and the settlement indicator option for IPM Financial Position Detail Reconciliation messages to differentiate amount totals for these transactions.

Customers may select category options by contacting their account manager or Mastercard Customer Implementation Specialist.

The Dual Message Clearing System offers the Clearing Cycle Acknowledgment (IP727010-AA) report for the reconciliation of Global Collection Only clearing activity. However, because the Dual Message Clearing System does not calculate the reconciliation amount on these transactions, the amount fields will be zero. The counts field will contain the number of collection items processed.

## First Presentment/1240: Global Collection Only format

A customer must submit various data as collection-only using the First Presentment/1240 transaction format in order to comply with the GCO Data Collection Program, referred to in this section as the First Presentment/1240: Global Collection Only format.

The following table identifies all mandatory and optional data elements and private data subelements for the First Presentment/1240: Global Collection Only transactions.

### First Presentment/1240 Global Collection Only data elements

| Data Element: 1240 | Data Element Name: 1240 | M: Mandatory/O: Optional |
|--------------------|-------------------------|--------------------------|
| -                  | Message Type Identifier | M                        |

## Global Collection Only mapping for Single Message System transactions

This section shows how to map a Financial Transaction Request/0200 transaction to the IPM format using field mapping.

Single Message System Financial Transaction Request/0200 data can be mapped to First Presentment/1240: Global Collection Only transactions. Note that some data cannot be mapped from or may not exist in the 0200 message and must be populated directly into the 1240 message.. For example, the function code in DE 24 must be populated with 0200 and does not come from any element in the 0200 message.

This table provides an example of how to build an First Presentment/1240: Global Collection Only transaction using Mastercard Single Message System format as the source.

This may be useful for customers that switch their global or cross-border transactions through the Single Message System and are required to report collection-only transactions to the Dual Message Clearing System in the First Presentment/1240: Global Collection Only format. The Single Message System format may differ slightly from a customer's local switch; however, it should provide a general baseline for customers.

### Mapping 0200 to 1240

## Cross-Border Fee Manager service

The Cross-Border Fee Manager service allows issuers to have the flexibility to set markup fees for both currency-conversion and cross-border transactions, taking into account various parameters.

- Issuer-identified account ranges or brands (for example, Mastercard®, Debit Mastercard, Maestro®, and Cirrus®)
- Transaction Group: Point-of-sale (POS), ATM, Card Present (Other), and Card Not Present
- Interregional versus intraregional transactions
- Transaction currency (cardholder versus other)

In combination with the default service in clearing, issuers can select authorization as an option. Markup fees are added to the cardholder billing amount (DE 6) without any impact to other data fields within the authorization. The markup amount provided within authorization serves as an estimate and may differ slightly from the amount within clearing due to fluctuations of the currency conversion rates used to calculate the final issuer markup.

Refer to the *Cross-Border Fee Manager Service Program Guide* for more information about this service.

## Cross-Border Fee Manager reports

Issuers can choose to receive daily audit report files that align with each clearing cycle from the Dual Message Clearing System.

This audit report will be available for the clearing transactions for which the Cross-Border Fee Manager calculation was performed.

Mastercard has added report IP830020 to bulk file TN70 for production and bulk file TN72 for testing.

For more information, refer to [Reports and files](#).

## Electronic commerce

Electronic commerce (e-commerce) transactions are non-face-to-face, online transactions that use electronic media over any public network such as the Internet, or private network. E-commerce processing allows transactions to be initiated from a cardholder-controlled device, such as a PC or mobile phone, for purchasing goods and services on the Internet.

### Customer requirements

To process e-commerce transactions:

- All issuers must be able to receive and process all e-commerce data present in the Authorization Request/0100 messages.
- All acquirers must properly identify e-commerce messages within the Authorization Request/0100 message.
- All acquirers must be able to receive and to process Authorization Request Response/0110 messages.

For detailed transaction flows and requirements associated with participation in the Identity Check program, refer to the *Mastercard Identity Check Program Guide*. For details about data requirements and transaction processing specifications authorization requests, refer to the *Mastercard Network Processing Dual Message Authorization System Guide*.

## Process for an electronic commerce transaction

The following diagram illustrates the flow of a typical e-commerce transaction.

### Electronic commerce transaction process

1. The cardholder accesses a merchant's website through the Internet and requests to make a purchase.
2. The merchant submits the cardholder's information to the acquirer.
3. The acquirer sends an Authorization Request/0100 message through the Mastercard Network to the issuer.
4. The issuer makes the authorization decision and replies using an Authorization Request Response/0110 message.

5. The acquirer responds to the merchant.
6. The merchant completes the transaction according to the authorization response returned.

## Security of electronic commerce transactions

There are various methods for securing e-commerce transactions that customers may process through the Mastercard Network.

Mastercard messaging requirements regarding e-commerce may vary depending on the security protocol involved in the transactions.

If a cardholder-initiated transaction (CIT) includes items unavailable for shipment when the order is placed, the merchant may initiate a subsequent transaction (MIT) identified as a partial shipment when those items are back in stock. For dispute purposes, in particular when cardholder authentication occurred at the time the order was placed, the partial shipment MIT may be linked or referenced back to the original CIT.

**NOTE: If UCAF data is not present, an e-commerce transaction must be presented within clearing for non-UCAF interchange (as applicable by region).**

For more information about Identity Check, including detailed transaction flows and participation requirements, refer to the *Mastercard Identity Check Program Guide*.

## Universal Cardholder Authentication Field

The Universal Cardholder Authentication Field (UCAF) is a standard, globally interoperable method of collecting cardholder authentication data at the point of interaction.

Within the Mastercard authorization networks, UCAF is a universal, multipurpose data transport infrastructure that is used to communicate authentication information between cardholders, merchants, acquirers, and issuers.

### Accountholder Authentication Value

The Accountholder Authentication Value (AAV) is a Mastercard Identity Check-specific implementation of UCAF related to issuer authentication platforms that incorporate the Secure Payment Application (SPA) algorithm. SPA is a Mastercard security method designed to authenticate cardholders when they pay online. All AAVs must be generated using the Mastercard SPA algorithm. With the EMV® 3-D Secure protocol and the Mastercard Identity Check program, Mastercard has created a SPA algorithm called SPA2. For more information about this algorithm, refer to the *SPA2 AAV and Verification Guide for the Mastercard Identity Check Program* on Mastercard Connect.

AAVs are generated by Mastercard and presented to the merchant for placement in the authorization request upon successful authentication of the cardholder or attempted authentication of the cardholder.

UCAF is used to transmit the AAV from the merchant to the issuer for authentication purposes during the authorization process.

Customers must perform AAV validation during the Authorization Request/0100 messages, either through their own self-validation process of their IAV (Issuer Authentication Value) or through the Mastercard Identity Check AAV Verification service.

All customers must participate in Mastercard Identity Check Dynamic AAV Verification in Stand-In Processing. This is now an automated rule-based process within Authorization for Stand-In Processing Authorization and Stand-In generated AAVs with Smart Authentication, IDC Insights, and IDC Express.

To implement the Mastercard Identity Check Dynamic AAV Verification service, login to the ISSM (Identity Solutions Services Management) application within Mastercard Connect. This is only for ACS enrolled account ranges for ACS authenticated AAVs.

**NOTE: All issuers globally that participate in Stand-In processing must have Mastercard Identity Check Dynamic AAV verification and Dynamic CVC 3 Validation in Stand-In performed during Stand-In processing.**

## Relationship between e-commerce and Mastercard Identity Check

Mastercard Identity Check builds upon the infrastructure requirements for channel encryption with the additional benefit of cardholder authentication.

When used in conjunction with components of the Mastercard payment infrastructure, Mastercard Identity Check provides a mechanism for online merchants to potentially receive an enhanced payment guarantee similar to what retailers (non-Internet) receive with qualifying physical point-of-sale transactions.

## UCAF in Digital Secure Remote Payments

The UCAF field is also used to support Digital Secure Remote Payments (DSRP) submitted as electronic commerce transactions that are initiated with MDES tokens.

In this case, the UCAF field contains an encoded list of data constructed according to UCAF format. .

## Extended Decimal Precision service

The Extended Decimal Precision (EDP) service provides participating customers with interchange calculated to six decimal positions for each transaction. Qualified transactions are totaled using a defined set of criteria, and then rounded. In the European Union countries, if the transactions are identified as regulated, the totaled amount is truncated.

Participation in the EDP service is established at the business service arrangement level. For more information on Business Service Arrangements, refer to [System functionality and services](#).

Transactions qualified for the EDP service have these attributes.

- EDP adjustment amounts are distributed in Fee Collection Messages with a message reason code of 7827 (Extended decimal precision adjustment amount).
- EDP adjustment amounts are applied to settlement on the next available settlement date.
- Customers receive PDS 0147 (Extended Precision Amounts).
- Customers can select to receive Reconciliation Messages, which provide EDP totals by
  - Debits, Extended Precision Amount in Reconciliation Currency (PDS 0397)
  - Credits, Extended Precision Amount in Reconciliation Currency (PDS 0398)
  - Amount, Net Extended Precision in Reconciliation Currency (PDS 0399)

**NOTE: Regardless of selected reconciliation options, customers receive separate reconciliation messages 1644-685 (Financial Position Detail) and 1644-688 (Settlement Position Detail) from Dual Message Clearing System for EDP and non-EDP transactions.**

## Extended Decimal Precision adjustment amount determination

Once daily, after the last clearing cycle, Mastercard calculates the EDP adjustment amount as follows.

- For each Transaction Originator (Sender)/Destination (Receiver) Institution ID pair and reconciliation currency, the amounts in PDS 0146 (Amounts, Transaction Fee), subfield 7 (Amount, Fee, Reconciliation) are summed.
- For each Transaction Originator (Sender)/Destination (Receiver) Institution ID pair and reconciliation currency, the amounts in PDS 0147 (Extended Precision Amounts), subfield 7 (Interchange Amount, Fee, Reconciliation) are summed.
- The totaled amounts of PDS 0146, subfield 7 are subtracted from the totaled amounts of PDS 0147, subfield 7 to calculate the EDP adjustment amount in sender and receiver reconciliation currency.

### EDP adjustment amount calculation example

All transactions in this example have these characteristics.

- First Presentment/1240 messages
- Transaction currency is EUR
- Sender Reconciliation Currency is EUR
- Receiver Reconciliation Currency is EUR
- Assume 1 EUR = 1.25 USD (mid currency conversion rate)

## EDP

| Transaction | Sender     | Receiver | Sender Fee Amount in Recon Currency (PDS 0146, SF 7) | Sender Interchange Amount, Fee, in Recon Currency (PDS 0147, SF 7) | Receiver Fee Amount in Recon Currency (PDS 0146, SF 7) | Receiver Interchange Amount, Fee, in Recon Currency (PDS 0147, SF 7) |

| Acquirer 4 | Issuer 3 | -70.00                                                   | -70.016199                                                             | -0.016199                                                                     | 70.00                                                      | 70.016199                                                                | 0.016199                                                                        |

### Net EDP adjustment of the acquirer

Net EDP adjustment amount of Acquirer 1 in USD =  $0.011062 * 1.25 = 0.013827 = 0.01$  USD (DR)

Net EDP adjustment amount of Acquirer 2 in USD =  $0.013785 * 1.25 = 0.017231 = 0.01$  USD (DR)

Net EDP adjustment amount of Acquirer 3 in USD =  $0.001899 * 1.25 = 0.002373 = 0.00$  USD (DR)

Net EDP adjustment amount of Acquirer 4 in USD =  $0.016199 * 1.25 = 0.020248 = 0.02$  USD (DR)

### Net EDP adjustment of the issuer

Net EDP adjustment amount of Issuer 1 in USD =  $0.021934 * 1.25 = 0.027417 = 0.02$  USD (CR)

Net EDP adjustment amount of Issuer 2 in USD =  $0.004812 * 1.25 = 0.006015 = 0.00$  USD (CR)

Net EDP adjustment amount of Issuer 3 in USD =  $0.016199 * 1.25 = 0.020248 = 0.02$  USD (CR)

The EDP adjustment amounts are reported per Institution ID in Fee Collection Messages, Message Type Indicator (MTI) = 1740, and Function Code (DE 24) = 783, with Message Reason Code (DE 25) = 7827.

The Fee Collection Messages are processed through the Dual Message Clearing System on the following Dual Message Clearing System Central Site Business Date.

Using the example above, the Dual Message Clearing System builds Fee Collection Messages as follows.

### Example Fee Collection

| DE 93 (Transaction Destination Institution ID Code) | DE 3 (Processing Code), SF 1 (Cardholder Transaction Type) | DE 4 (Amount, Transaction) | DE 49 (Currency Code, Transaction) |
|-----------------------------------------------------|------------------------------------------------------------|----------------------------|------------------------------------|
| Acquirer 1                                          | 19                                                         | 0000000000001              | 840                                |
| Acquirer 2                                          | 19                                                         | 0000000000001              | 840                                |
| Acquirer 4                                          | 19                                                         | 0000000000002              | 840                                |
| Issuer 1                                            | 29                                                         | 0000000000002              | 840                                |
| Issuer 3                                            | 29                                                         | 0000000000002              | 840                                |

### Balancing reconciliation messages to transactions

- Accumulate financial transactions by selected reconciliation options and currency.
- Sum PDS 0146, subfield 7 debits and match to the debits' fee amount received in PDS 0392 (Debits, Fee Amounts in Reconciliation Currency).
- Sum PDS 0146, subfield 7 credits and match to the credits' fee amount received in PDS 0393 (Credits, Fee Amounts in Reconciliation Currency).
- Net PDS 0146, subfield 7 debits and credits and match to the net fee amount received in PDS 0395 (Amount, Net Fee in Reconciliation Currency).
- Sum PDS 0147, subfield 7 debits and match to the debits' fee amount received in PDS 0397 (Debits, Extended Precision Amount in Reconciliation Currency).
- Sum PDS 0147, subfield 7 credits and match to the credits' fee amount received in PDS 0398 (Credits, Extended Precision Amount in Reconciliation Currency).
- Net PDS 0147, subfield 7 debits and credits and match to the net fee amount received in PDS 0399 (Amount, Net Extended Precision in Reconciliation Currency).

### Balance reconciliation messages to Clearing Acknowledgment and Notification Cycle Reports

The net sum of PDS 0394 (Amount, Net Transaction in Reconciliation Currency) and PDS 0395 (Amount, Net Fee in Reconciliation Currency) will match to the IP727010-AA Clearing Cycle Acknowledgment and IP727020-AA Clearing Cycle Notification Reports.

## Fleet Card transactions

The Mastercard Corporate Fleet Card® is designed to monitor and control fuel and maintenance expenses. A Mastercard Corporate Fleet Card program can be assigned to an individual employee or to a vehicle.

Mastercard Corporate Fleet Card transactions are identified with a specific dedicated Primary Account Number, BIN range, and a Financial Network Code of MCF (Mastercard Corporate Fleet Card) or MGF (Mastercard Government Commercial Card).

For more information, refer to the *Fleet Implementation Guide Global* and *Fleet Implementation Guide For the U.S. Region*.

### Incentive interchange rates

Acquirers receive incentive interchange rates for transactions that support the data collection requirements of Mastercard Corporate Fleet Card® transactions.

To receive the incentive interchange rates for Fleet Card transactions, acquirers must capture specific data to support submission requirements for clearing records.

For clearing record requirements, refer to the appropriate regional interchange manual.

## Issuer Currency Conversion Rate (ICCR) service

The Issuer Currency Conversion Rate (ICCR) is a parameter-based service that charges cardholders by applying a mark-up called ICCR in clearing.

### Overview

Issuers in the Europe region have the option to enroll in the ICCR service, which charges the cardholder an additional fee for transactions that require currency conversion.

Issuers in the Europe region can add this supplemental fee to a transaction amount when the transaction currency is different from the cardholder billing currency. This fee is listed under DE 6 (Amount, Cardholder Billing).

Issuers can set their issuer currency conversion rate by account range, which will apply to first presentment messages. Issuers can also apply ICCR to first presentment reversals and credits.

Issuers have the option to apply a back-out process for the ICCR amount on first chargebacks (and reversals) in cases where the ICCR amount is included in the DE 4 (Amount, Transaction) amount on chargebacks.

Issuers can receive daily audit report files of the clearing transactions where the ICCR was applied.

ICCR applies to POS and ATM transactions acquired worldwide.

In the Dual Message Clearing System, all payment transactions (processing code = 28) are bypassed for ICCR.

## ICCR enrollment

All issuers in the Europe region that choose to enroll in the ICCR service must submit the correct enrollment form.

Contact your Mastercard representative for enrollment information.

## ICCR reports

Issuers can choose to receive daily audit report files that align with each clearing cycle from the Dual Message Clearing System.

This audit report will be available for the clearing transactions for which the ICCR calculation was performed.

For more information, refer to the [IP830010 - Issuer ICCR Report](#).

## Mastercard In Control platform

The Mastercard In Control platform is an optional service with the following capabilities:

- Enhanced authorization controls that direct how, when, and where cards may be used.
- Personalized real-time communication about transaction activities through a robust alert functionality.
- Enhanced levels of security, control, data capture, and traceability on every purchase through a limited use number feature that allows authorization, spending limits, and usability controls to be set on a transaction-by-transaction basis.
- The ability for cardholders to establish spend-control rules for their pre-existing payment cards to be applied during the authorization process.
- Enhanced purchase controls for Mastercard commercial cards. In addition to other capabilities, this service platform allows for the generation of a unique Mastercard In Control virtual card number for every transaction.

Refer to the *Mastercard In Control for Commercial Payments Issuer Application Specification Guide* for detailed information.

## Dual Message Clearing System processing for the Mastercard In Control platform

The Mastercard In Control service processes normally in the Dual Message Clearing System with certain exceptions.

- Transactions with the Mastercard In Control virtual card number (VCN) in DE 2 (Primary Account Number) are rejected back to the acquirer if mapping to the cardholder's real card

number (RCN) cannot be performed. An example would be an unauthorized, fraudulent clearing transaction using a Mastercard In Control account number.

- PDS 0001 (Mastercard Mapping Service Account Number) is included in the transaction messages sent to the issuer when PAN Mapping has been performed. PDS 0001 contains the Mastercard In Control VCN. PDS 0001 is not included in transaction messages sent to the acquirer when PAN mapping has been performed.
- Chargebacks are not rejected back to the issuer if there is no mapping for the transaction. Mastercard attempts to map every chargeback, and if this is not successful, processing will proceed as usual.
- A Spend Control RCN Switch is in the IPM MPE Table IP0040T1: Issuer Account Range. This switch is set to Y when the account range participates in Mastercard In Control Real Card Spend Control services. Rules for the Real Card Spend Control service are enforced during the authorization process.

For In Control First Presentment/1240 messages:

- If PDS 0502 (Custom Identifier) is present in the First Presentment/1240 message, then the values will be overlaid with the value OTHER1 in subfield 1 (Custom Identifier Type) and the Virtual Account Number in subfield 2 (Custom Identifier Detail).
- If PDS 0502 is not present in the First Presentment/1240 message, then PDS 0502 is added to the message and sent to the issuer. The values are OTHER1 in subfield 1 (Custom Identifier Type) and the Virtual Account Number in subfield 2 (Custom Identifier Detail).

## Mastercard In Control mapping process

The mapping processes for both acquirer-initiated and issuer-initiated transactions are described in the Mapping Process for Acquirer-initiated Transactions and Mapping Process for Issuer-initiated Transactions tables.

Mastercard supports a virtual card number (VCN) as an optional service for Mastercard In Control participants. This added layer of security protects issuers and cardholders against the risk of fraudulent acquisition and use of a Mastercard In Control account number.

Mastercard maps the VCN to the PAN for processing for acquirer-initiated transactions.

### Mapping process for acquirer-initiated transactions

| Stage | Description                                          |
|-------|------------------------------------------------------|
| 1.    | The VCN is sent to the Dual Message Clearing System. |

| Stage | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2.    | <p>The Dual Message Clearing System maps the VCN to the cardholder PAN.</p> <p>The PAN is used during the clearing process.</p> <ol style="list-style-type: none"><li>1. The first attempt to match to the mapping service authorization log according to the combination of VCN, Banknet Reference Number, and Banknet Date.<ul style="list-style-type: none"><li>– VCN is in DE 2 (Primary Account Number [PAN])</li><li>– The Banknet Reference Number and Date are present in DE 63 (Transaction Life Cycle ID), subfield 2 (Trace ID) in First Presentment/1240 messages.</li></ul></li><li>2. If the Dual Message Clearing System does not find a match in the mapping service authorization log, or if DE 63 is not present in the First Presentment/1240 message, Dual Message Clearing System attempts to match to the mapping service database using the VCN and registration flag.</li><li>3. If the Dual Message Clearing System cannot match the First Presentment/1240 message, Dual Message Clearing System rejects the transaction.</li></ol> |
| 3.    | <p>The issuer receives the cardholder's PAN in DE 2 (Primary Account Number [PAN]) and the VCN in PDS 0001 (Mastercard Mapping Service Account Number).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

### Mapping process for issuer-initiated transaction

| Stage | Description                                                                                                                                                                                                |
|-------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1.    | <p>The RCN is sent in DE 2.</p> <p>This DE 2 account number is used during the clearing process.</p>                                                                                                       |
| 2.    | <p>Clearing recognizes the transaction as a mapped transaction by checking the virtual presentment history table and maps the cardholder's PAN to the VCN.</p>                                             |
| 3.    | <p>The acquirer receives the VCN in DE 2.</p> <p><b>NOTE: The acquirer only receives the masked RCN in PDS 0001 (Mastercard Mapping Service Account Number) for retrieval and chargeback requests.</b></p> |

**NOTE: Transactions that contain the VCN in DE 2 and which cannot be mapped are rejected back to the sender.**

When acquirers receive PDS 0001, the subfield 2 (Account Number) always contains a masked card number. The real card number (RCN) is masked according to PCI guidelines by:

- Displaying the first six digits
- Filling the remaining digits of the real card number with zeros, and
- Displaying the final four digits (for example: 12345600000001234 for a 16-digit PAN or 12345600000000001234 for a 19-digit PAN).

## Mastercard Contactless and PAN Mapping Service

This section describes how the Dual Message Clearing System performs transaction processing for Mastercard contactless and the PAN Mapping Service.

### Overview

Mastercard supports account level processes for Mastercard contactless and PAN Mapping Service. Using proximity chip payment technology, consumers can pay for their purchases at the point of sale by tapping their Mastercard contactless card or non-card form factor on a Mastercard contactless terminal. The Mastercard contactless card or non-card form factor transmits the card information to the terminal. The Mastercard contactless terminal interacts with existing authorization mechanisms to initiate and complete the authorization.

## Mastercard contactless Mapping Service participation guidelines

Participation in the Mastercard contactless and PAN Mapping Service, including definitions of Mastercard contactless account number and primary account number (PAN), requires a user to follow various guidelines.

Mastercard contactless account number is a unique number encoded on the proximity chip of a Mastercard contactless card or non-card form factor that the Mastercard PAN Mapping Service associates with the PAN.

PAN is the number that is embossed, encoded, or both, on a Mastercard card that identifies the issuer and the particular cardholder account.

Mastercard recommends that a unique account number be used for Mastercard contactless transactions. This unique account number is the optimal way to avoid the risk of cross-contamination. Use of a unique account number in the Mastercard contactless chip is accepted by the issuer only if the value in DE 22 (Point of Service [POS] Entry Mode), subfield 7 (Card Data Input Mode) indicates proximity (for example, from a Mastercard contactless chip). This comparison allows blocking of the authorization for transactions presented through non-proximity channels such as magnetic stripe, mail order/telephone order (MO/TO), and the Internet.

Implementation of a separate Mastercard contactless account number requires the issuer to:

- Allocate an extra account number to provide Mastercard contactless functionality for an existing PAN.
- Establish a cross-reference between the PAN and the Mastercard contactless account number so that they are managed together, if required.

Mastercard recognizes that the use of a separate Mastercard contactless account number for some issuers may not be viable; therefore, Mastercard created the Mastercard PAN Mapping Service. This optional service helps issuers process Mastercard contactless transactions by translating Mastercard contactless account numbers into PANs that issuers can process with

minimal impact. Mastercard contactless account numbers eligible for the service may belong to a Mastercard issuer.

For a detailed overview of these guidelines, refer to the *Account Management System User Manual*.

## PAN Mapping Service

Through the Mastercard PAN Mapping Service, Mastercard can provide Mastercard contactless issuance and processing services as described in this section.

### Processing-only participation in the Mastercard contactless Mapping Service

Issuers may choose to offer the Mastercard contactless Mapping Service by creating the mapping file themselves. This choice is referred to as Processing-only participation.

In this scenario, the issuers provide Mastercard with a file mapping their cardholders' PAN to Mastercard contactless account numbers. The issuer or Mastercard then provides each cardholder with a Mastercard contactless card or non-card form factor containing a Mastercard contactless account number.

When the Mastercard contactless card or non-card form factor is used at a Mastercard contactless terminal, the transaction first comes to Mastercard, where the Mastercard contactless account number is replaced with the cardholder's PAN.

### Processing and issuance of non-card form factor participation

Individual consumers may request a Mastercard contactless card or non-card form factor from a secure website. This process is referred to as Processing and Issuance of Non-card Form Factor participation.

Cardholders use a secure website to request or register a Mastercard contactless card or non-card form factor and enter the PAN they would like to associate with it. The website performs some security checks on the information entered and then approves the request. Mastercard then provides the cardholder with the Mastercard contactless card or non-card form factor requested. Upon receipt, the cardholder returns to the website and registers the Mastercard contactless card or non-card form factor to activate the Mastercard contactless account number. Mastercard collects the information provided through the website and creates the file mapping of the Mastercard contactless account number to the PAN.

## Process flow of the Mastercard PAN Mapping Service

Mastercard maintains a Mastercard PAN Mapping Service database that maps Mastercard contactless account numbers to PANs.

The Mastercard contactless Mapping Service database is used by the Mastercard Network and the Dual Message Clearing System. This allows acquirers to process transactions using the Mastercard contactless account number and the issuer to process transactions using the PAN.

1. When a consumer taps an eligible Mastercard contactless card or non-card form factor on a Mastercard contactless terminal, the card or non-card form factor transmits the Mastercard contactless account number to the terminal.
2. The Mastercard contactless terminal passes the Mastercard contactless account number and other authorization information to the acquirer.
3. The acquirer initiates an authorization message containing the Mastercard contactless account number and sends it to the Mastercard Network.
4. The Mastercard Network maps the Mastercard contactless account number to the cardholder's PAN before sending the transaction to the issuer.
5. The issuer responds with an authorization response message containing the PAN.
6. The Mastercard Network maps the cardholder's PAN back to the Mastercard contactless account number and sends the response message on to the acquirer.
7. The acquirer forwards the Mastercard contactless account number and other authorization response information to the Mastercard contactless terminal.
8. The Mastercard Network logs all authorizations for which it performed the Mastercard PAN Mapping Service and makes this information available to the Dual Message Clearing System.
9. The acquirer sends the corresponding message containing the Mastercard contactless account number to the Dual Message Clearing System.
10. The Dual Message Clearing System maps the Mastercard contactless account number to the PAN using either the authorization logs or the Mastercard PAN Mapping Service database before sending the clearing message to the issuer for posting.
11. Issuers can send subsequent chargeback messages to the Dual Message Clearing System containing the cardholder's PAN, and the Dual Message Clearing System maps the cardholder's PAN to the Mastercard contactless account number before sending the message to the acquirer.

## Identifying issuer account ranges with IPM MPE

The IPM MPE table can identify issuer account ranges that participate in the contactless mapping service. IPM MPE table IP0040T1: Issuer Account Range contains the Mapping Service Indicator field. This field identifies issuer account ranges that require the Mastercard PAN Mapping Service.

This field contains one of the following values for each issuer account range.

### IPM MPE table IP0040T1: Issuer Account Range

| Value | Description                                                                                                                                                                                                         |
|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| space | The issuer account range does not participate in the Mastercard PAN Mapping Service.                                                                                                                                |
| 1     | The issuer account range consists of PAN account numbers owned by an issuer, in which the issuer actively participates in the PAN Mapping Service. Every transaction containing this account range is to be mapped. |

| Value | Description                                                                                                                                                                                                                                                                                                                        |
|-------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2     | The issuer account range consists of PAN account numbers owned by an issuer, in which the issuer actively participates in the PAN Mapping Service. Not all transactions containing this account range are to be mapped because the issuer is phasing in the PAN Mapping Service.                                                   |
| 3     | The issuer account range consists of contactless account numbers provided by Mastercard, assigned to an issuer that participates in the Processing Only option of the PAN Mapping Service.                                                                                                                                         |
| 4     | The issuer account range consists of PAN account numbers provided by Mastercard, assigned to an issuer that participates in the Processing and Issuance of non-card form factor option of the contactless Mapping Service by permitting its cardholders to request a contactless card or non-card form factor through the website. |
| 5     | The issuer account range consists of contactless account numbers provided by Mastercard, assigned to a merchant that sponsors the contactless card or non-card form factor. The issuer passively participates in the PAN Mapping Service.                                                                                          |
| 6     | The issuer account range consists of contactless account numbers provided by Mastercard, and Mastercard sponsors the contactless card or non-card form factor. The issuer passively participates in the PAN Mapping Service.                                                                                                       |

Before distributing contactless non-card form factors to consumers, Mastercard adds issuer account ranges that consist of contactless account numbers to the IPM MPE files. The IPM MPE file contains valid Dual Message Clearing System product IDs, country codes, and other fields necessary for processing for these issuer account ranges. They are assigned to participate in all the default interregional, intraregional, and intracountry business services that are relevant to their assigned country codes.

**NOTE: If an issuer account range contains a value of 1-6 in this new field in the IPM MPE, acquirers must send ALL transactions involving this issuer account range to Mastercard for authorization and clearing because only the Mastercard systems contain the data needed to map a contactless account number to a PAN. Transactions processed in an On-Us or intraprocessor mode will not have access to this mapping data.**

## Identifying PAN Mapping within IPM Messages

### Contents of PDS 0001 (Mastercard Mapping Service Account Number)

The Dual Message Clearing System provides PDS 0001 message in which it maps between a contactless account number and a PAN.

#### PDS 0001, subfield 1 (Account Number Type)

PDS 0001 (Mastercard Mapping Service Account Number), subfield 1 describes the type of account number contained in PDS 0001, subfield 2 (Account Number).

### **PDS 0001, subfield 2 (Account Number)**

Subfield 2 contains a virtual or real account number or a PAN. When issuers receive PDS 0001, the subfield 2 always contains a virtual account number.

This subfield is 6-19 digits in length.

For detailed information regarding the contents of PDS 0001, refer to [PDS 0001 \(Mastercard Mapping Service Account Number\)](#).

### **Contents of DE 22 (Point of Service [POS] Entry Mode), Subfield 7 (Card Data, Input Mode)**

Currently, issuers only receive values A or M when sent by the acquirer.

For the mapping of contactless M/Chip and Contact M/Chip transactions in the PAN Mapping Service, Mastercard will pass through the values (C and M) as provided by the acquirer.

The issuer must send the same values (either the C or M value), which are the original values sent by the acquirer, in any subsequent First Chargeback/1442 or Arbitration Chargeback/1442 messages.

### **Processing transactions through the Mastercard contactless Mapping Service**

Transactions involving Mastercard contactless account numbers must be sent to the Dual Message Authorization and Dual Message Clearing Systems, because these are the only systems that have access to the Mastercard PAN Mapping Service database needed to map between Mastercard contactless account numbers and PANs.

1. The Mastercard Network maps a Mastercard contactless account number to a PAN before sending the authorization message to the issuer, and it maps the PAN back to the Mastercard contactless account number before sending the authorization response to the acquirer. The acquirer then receives an authorization response message containing the Mastercard contactless account number.
2. The acquirer populates DE 2 in the First Presentment/1240 message with the Mastercard contactless account number captured by the Mastercard contactless terminal.
3. Dual Message Clearing System performs the Mastercard PAN Mapping Service for the First Presentment/1240 and any subsequent lifecycle transactions. All clearing messages received by the issuer contain the PAN in DE 2, the Mastercard contactless account number in PDS 0001 (Mastercard Mapping Service Account Number), and a value of A or M in DE 22 (Point of Service [POS] Entry Mode), subfield 7 (Card Data, Input Mode). All clearing messages received by the acquirer contain the Mastercard contactless account number in DE 2, the PAN in PDS 0001, and the acquirer's originally submitted value in DE 22, subfield 7.

## DE 22 values identify contactless transactions to Dual Message Clearing System

These are the requirements to perform the Mastercard contactless Mapping Service for various messages.

To perform the PAN Mapping Service for First Presentment/1240 messages, Dual Message Clearing System requires that the First Presentment/1240 contain DE 22 (Point of Service [POS] Entry Mode), subfield 7 (Card Data, Input Mode) with a value of A or M to indicate PAN entry through a contactless mode. The acquirer must provide one of these values in a First Presentment/1240 message when DE 2 contains a contactless account number.

To perform the PAN Mapping Service for First Chargeback/1442 and Arbitration Chargeback/1442 messages, Dual Message Clearing System requires that the chargeback message contain DE 22, subfield 7 with a value of A or M, which are the original values sent by the acquirer, to indicate that the Dual Message Clearing System performed the PAN Mapping Service for the first presentment. The issuer receives this value in the First Presentment/1240 message and must provide it in any subsequent chargeback message to identify to Dual Message Clearing System when to map a PAN back to a contactless account number.

Therefore, issuers that participate in PAN mapping must be able to receive and provide DE 22, subfield 7, value A (PAN auto-entry through contactless magnetic stripe) or M (PAN auto-entry through contactless M/Chip), which are the original values sent by the acquirer, in IPM clearing messages, even if they do not issue contactless cards.

## Processing First Presentment/1240 messages through the Mastercard contactless Mapping Service

When processing a First Presentment/1240, the Dual Message Clearing System validates the contents of DE 2 (Primary Account Number [PAN]) against IPM MPE table IP0040T1.

If the Mapping Service Indicator field in table IP0040T1 indicates that DE 2 contains a service-eligible Mastercard contactless account number (indicated by a value of 1 to 6 in the Mapping Service Indicator field), the Dual Message Clearing System checks DE 22 (Point of Service [POS] Entry Mode), subfield 7 (Card Data, Input Mode) to ensure that it is present and that it contains a value of A or M to indicate PAN entry through a contactless mode. If DE 22, subfield 7 contains A or M, the Dual Message Clearing System continues processing. If DE 22, subfield 7 does not contain A or M, the Dual Message Clearing System rejects the transaction because this would be a fraudulent use of the Mastercard contactless account number.

1. The Dual Message Clearing System first attempts to match to the Mastercard PAN Mapping Service authorization log according to the combination of Mastercard contactless account number and Banknet Reference Number and Date. The Mastercard contactless account number is in DE 2. The Banknet Reference Number and Date are present in DE 63 (Transaction Life Cycle ID), subfield 2 (Trace ID) in the First Presentment/1240.
2. If the Dual Message Clearing System does not find a match in the Mastercard PAN Mapping Service authorization log, or if DE 63 is not present in the First Presentment/1240, the Dual

Message Clearing System attempts to match to the Mastercard PAN Mapping Service database using the Mastercard contactless account number in DE 2.

3. If the Dual Message Clearing System cannot match the First Presentment/1240 message to either the Mastercard PAN Mapping Service authorization log or the Mastercard PAN Mapping Service database, the Dual Message Clearing System rejects the transaction.

After successfully mapping the Mastercard contactless account number to a PAN, the Dual Message Clearing System uses the PAN in its processing. For example, it uses business services in which the issuer of the PAN participates, and it delivers the transaction to the endpoint associated with the issuer of the PAN, as opposed to the Mastercard contactless account number. If the transaction contains no errors, the Dual Message Clearing System modifies the data before sending the First Presentment/1240 to the issuer by:

- Moving the Mastercard contactless account number from DE 2 to PDS 0001 (Mastercard Mapping Service Account Number), subfield 2 (Account Number)
- Populating DE 2 with the PAN
- Passing through the value received from the acquirer in DE 22, subfield 7

The Dual Message Clearing System also logs the mapped transaction to a Mastercard PAN Mapping Service First Presentment history file. Any acknowledgment reconciliation messages or reporting created for the acquirer is based on the Mastercard contactless account number. Any notification reconciliation messages or reporting created for the issuer is based on the PAN.

If the transaction is rejected for any existing Dual Message Clearing System error, the Dual Message Clearing System sends the rejected transaction back to the acquirer with the acquirer's originally submitted values in DE 2.

For chargebacks and retrieval requests, issuers should use:

- Value A (for Contactless Magnetic Stripe transactions)
- Value M (for Contactless M/Chip transactions)
- Value R (for Digital Secure Remote Payment containing EMV data transactions)
- Value S (for Digital Secure Remote Payment containing UCAF data transactions or Card on File, Electronic Commerce tokenization)
- Value T (for Card on File tokenization)

## **Processing First Chargeback/1442 messages through the Mastercard contactless Mapping Service**

The issuer populates DE 2 (Primary Account Number [PAN]) with the PAN in all chargeback messages.

In addition, for First Chargeback/1442 messages, the issuer must also populate DE 22 (Point of Service [POS] Entry Mode), subfield 7 (Card Data, Input Mode) with A or M. This value is needed to indicate that the Dual Message Clearing System must map the PAN in DE 2 to a Mastercard contactless account number.

For First Chargeback/1442 messages, the Dual Message Clearing System attempts to match the PAN in DE 2 to the Mastercard PAN Mapping Service First Presentment history file if DE 22, subfield 7 is present and contains a value of A or M.

The Dual Message Clearing System attempts to match to the history file using the following fields.

### Matching criteria for retrieval requests and chargebacks

| Dual Message Clearing System attempts to match this combination of fields in the chargeback message... | To this combination of fields in the Mastercard PAN Mapping Service First Presentment history file |
|--------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------|
| DE 2 (Primary Account Number)                                                                          | PAN                                                                                                |
| DE 31 (Acquirer Reference Data)                                                                        | DE 31                                                                                              |
| DE 30 (Amounts, Original) subfield 1 (Original Amount, Transaction)                                    | DE 4 (Amount, Transaction)                                                                         |
| PDS 0149 (Currency Codes, Amounts, Original), subfield 1 (Currency Code, Original Transaction Amount)  | DE 49 (Currency Code, Transaction)                                                                 |
| DE 12 (Date and Time, Local Transaction), subfield 1 (Date)                                            | DE 12, subfield 1                                                                                  |

If the chargeback message does not contain DE 22, subfield 7 with a value of A, C, or M, the Dual Message Clearing System assumes that it did not perform the Mastercard PAN Mapping Service at the time of the First Presentment/1240. The Dual Message Clearing System continues processing the First Chargeback/1442 message as it normally does and delivers the message to the acquirer with the PAN in DE 2 and the issuer's submitted values in DE 22. If, upon receipt, the acquirer does not recognize the transaction because the First Presentment/1240 had actually been submitted with a Mastercard contactless account number, the acquirer must follow existing dispute resolution rules and procedures that apply when the PAN is not recognized.

If the Dual Message Clearing System does successfully match the message to the Mastercard PAN Mapping Service First Presentment history file, and the message is a First Chargeback/1442, Dual Message Clearing System validates that the chargeback amount is greater than the regional limit for reason code 4837.

If the mapped chargeback transaction contains no errors, the Dual Message Clearing System modifies the data before sending the message to the acquirer by:

- Moving the PAN from DE 2 to PDS 0001, subfield 2
- Populating DE 2 with the contactless account number

- Populating DE 94 (Transaction Originator Institution ID Code) and DE 33 (Forwarding Institution ID Code) with customer ID information related to the contactless account number
- Moving the value originally submitted by the acquirer in the First Presentment/1240 message to DE 22, subfield 7 if the issuer provided the other DE 22 subfields in the retrieval or chargeback

When the Dual Message Clearing System logs the First Chargeback/1442 message to its existing retrieval or chargeback history files, it logs both the PAN and the Mastercard contactless account number. Any acknowledgment reconciliation messages or reports created for the issuer are based on the PAN. Any notification reconciliation messages or reports created for the acquirer are based on the Mastercard contactless account number.

### **Processing Second Presentment/1240 messages through the Mastercard contactless Mapping Service**

Details about the processing of Second Presentment/1240 messages through the Mastercard contactless Mapping Service are described here.

The acquirer populates DE 2 (Primary Account Number [PAN]) with the Mastercard contactless account number in the Second Presentment/1240. The Dual Message Clearing System attempts to match all Second Presentment/1240 messages to the existing chargeback history file as usual. If the Dual Message Clearing System is unable to match the message to the chargeback history file, it rejects the Second Presentment/1240.

If the Dual Message Clearing System successfully matches the Second Presentment/1240 to the chargeback history file, and the chargeback history file indicates that DE 2 contains a Mastercard contactless account number, the Dual Message Clearing System maps it to the PAN and uses the PAN in its processing. For example, it uses business services in which the issuer of the (PAN) participates, and it delivers the transaction to the endpoint associated with the issuer of the PAN as opposed to the Mastercard contactless account number. If the transaction contains no errors, the Dual Message Clearing System modifies the data before sending the Second Presentment/1240 to the issuer by:

- Moving the Mastercard contactless account number from DE 2 to PDS 0001 (Mastercard Mapping Service Account Number), subfield 2 (Account Number)
- Populating DE 2 with the PAN

Any acknowledgment reconciliation messages or reports created for the acquirer are based on the Mastercard contactless account number. Any notification reconciliation messages or reports created for the issuer are based on the PAN.

### **Processing Fee Collection (Retrieval Fee Billing)/1740 messages through the Mastercard contactless Mapping Service**

A Fee Collection (Retrieval Fee Billing)/1740 message is used only when an issuer has requested a hardcopy retrieval document, the acquirer fulfills the request through Mastercom, and the acquirer seeks to collect the delivery fee from the issuer as reimbursement for costs associated with delivering the hardcopy document to the issuer.

The acquirer populates DE 2 (Primary Account Number [PAN]) with the service-eligible Mastercard contactless account number in the Fee Collection (Retrieval Fee Billing)/1740. The Dual Message Clearing System validates the contents of DE 2 against IPM MPE table IP0040T1, as usual. If the Mapping Service Indicator field in table IP0040T1 indicates that DE 2 contains a service-eligible Mastercard contactless account number, the Dual Message Clearing System maps the Mastercard contactless account number in DE 2 to the PAN using the Mastercard PAN Mapping Service First Presentment history file.

If the Dual Message Clearing System cannot match the Fee Collection (Retrieval Fee Billing)/1740 message to the Mastercard PAN Mapping Service First Presentment history file, the Dual Message Clearing System rejects the transaction.

After successfully mapping the Mastercard contactless account number to a PAN, the Dual Message Clearing System uses the PAN in its processing. For example, it uses business services in which the issuer of the PAN participates, and it delivers the transaction to the endpoint associated with the issuer of the PAN, as opposed to the Mastercard contactless account number. If the transaction contains no errors, the Dual Message Clearing System modifies the data before sending the message to the issuer by:

- Moving the Mastercard contactless account number from DE 2 to private data subelement (PDS) 0001 (Mastercard Mapping Service Account Number), subfield 2 (Account Number)
- Populating DE 2 with the PAN

Any acknowledgment reconciliation messages or reports created for the acquirer are based on the Mastercard contactless account number. Any notification reconciliation messages or reports created for the issuer are based on the PAN.

## Elements used by the Mastercard Contactless Mapping Service

This table summarizes the contents of the elements that are affected when the Dual Message Clearing System performs the Mastercard contactless Mapping Service.

### Elements used by the Mastercard Contactless Mapping Service

| Clearing Message       | Scenario                    | DE 2                       | PDS 0001, Subfield 2 | DE 22, subfield 7                                                  | DE 94 and DE 33                                             |
|------------------------|-----------------------------|----------------------------|----------------------|--------------------------------------------------------------------|-------------------------------------------------------------|
| First Presentment/1240 | From acquirer to Mastercard | contactless account number | Not present          | A or M                                                             | As provided by the acquirer                                 |
| Retrieval Request/1644 | From issuer to Mastercard   | PAN                        | Not present          | As provided by the issuer                                          | As provided by the issuer                                   |
|                        | From Mastercard to acquirer | contactless account number | PAN                  | A or M, if the issuer provided other DE 22 values in the retrieval | Customer IDs associated with the contactless account number |

| Clearing Message                            | Scenario                    | DE 2                       | PDS 0001, Subfield 2       | DE 22, subfield 7                                                       | DE 94 and DE 33                                             |
|---------------------------------------------|-----------------------------|----------------------------|----------------------------|-------------------------------------------------------------------------|-------------------------------------------------------------|
| Fee Collection (Retrieval Fee Billing)/1740 | From acquirer to Mastercard | contactless account number | Not present                | DE 22 not in message layout                                             | As provided by the acquirer                                 |
|                                             | From Mastercard to issuer   | PAN                        | contactless account number | DE 22 not in message layout                                             | As provided by the acquirer                                 |
| First Chargeback/ 1442                      | From Mastercard to acquirer | contactless account number | PAN                        | A, C, or M, if issuer provided other DE 22 values in the chargeback     | Customer IDs associated with the contactless account number |
| Second Presentment/ 1240                    | From acquirer to Mastercard | contactless account number | Not present                | A or M                                                                  | As provided by the acquirer                                 |
|                                             | From Mastercard to issuer   | PAN                        | contactless account number | A or M                                                                  | As provided by the acquirer                                 |
| Arbitration Chargeback/ 1442                | From issuer to Mastercard   | PAN                        | Not present                | A or M                                                                  | As provided by the issuer                                   |
|                                             | From Mastercard to acquirer | contactless account number | PAN                        | A, C, or M, if the issuer provided other DE 22 values in the chargeback | Customer IDs associated with the contactless account number |

## Interchange compliance processing

Mastercard performs the Mastercard contactless Mapping Service for First Presentment/1240 messages, which are analyzed during the interchange compliance process.

As described in the *Mastercard Network Processing Dual Message Authorization System Guide*, transactions for which the Dual Message Authorization System performs the Mastercard PAN Mapping Service do not contain magnetic stripe data when they are sent to the issuer and logged by the Mastercard Network. Therefore, U.S.-acquired First Presentment/1240 messages for which Mastercard performs the Mastercard PAN Mapping Service may not pass the magnetic stripe quality test within the interchange compliance process. This test requires validation of the magnetic stripe presence at the time of the authorization for specific incentive interchange programs, unless the transaction is exempt.

Mastercard modified the interchange compliance magnetic stripe quality test to exempt transactions in which PDS 0001 is present in the First Presentment/1240 message. The presence of PDS 0001 indicates that Mastercard performed the Mastercard PAN Mapping

Service; and therefore, magnetic stripe data is not expected to be present in the authorization message.

## Mastercom processing

Acquirers and issuers use Mastercom to resolve disputed transactions by participating in Mastercom Collaboration and by creating chargebacks, second presentments, and cases as part of the dispute cycle.

Mastercom consists of two tabs within a single application: Claims Manager and Dispute Resolution. Mastercom helps facilitate efficient sharing of information and documentation during the dispute cycle to determine which party has financial responsibility for disputed transactions.

To use Mastercom and participate in the dispute resolution process, acquirers and issuers are required to have at least one Mastercom user account. Mastercard assigns all customers a Mastercom endpoint to help with the routing of chargeback documentation through the application.

## Mastercard Digital Enablement Service

This section describes the Mastercard Digital Enablement Service (MDES) as it pertains to the clearing process.

### Overview

MDES supports tokenization and card digitization for use during contactless e-commerce and Dynamic Magnetic Stripe Data transactions. Mastercard maintains a PAN mapping database that maps tokens to PANs. This database is used by both the Dual Message Authorization and Dual Message Clearing Systems, so that the acquirer can always process using the token and the issuer can always process using the PAN.

Transactions that would use a token include:

- Tapping a device to a contactless reader at a point-of-sale (POS) terminal
- Initiating a Digital Secure Remote Payment (DSRP) with a mobile wallet or web-based payment application that uses MDES
- Using a device provisioned with a token that is able to leverage the magnetic stripe reader at a POS terminal (for dynamic magnetic stripe data transactions)
- Initiating an e-commerce transaction with a payment application on a website hosted by a Digital Activity Customer (DAC), such as a wallet provider or token requestor that uses MDES static tokens that do not have dynamic payment credentials
- Initiating a credential-on-file transaction

Refer to *MDES Technical Specifications for Dual and Single Message Systems*, for detailed information.

## Mastercard Digital Enablement Service authorization process flows

The following explains the process flows when a transaction is generated using a token.

### Process flow for token or dynamic magnetic stripe data

1. The cardholder initiates a transaction with a token.
2. The acquirer initiates an authorization request containing the token and chip or dynamic magnetic stripe data and sends it to the Mastercard Network, providing DE 22 (POS [POS] Entry Mode), subfield 1 (Terminal Data, Card Data Input Capability) with a valid value.
3. For secure element and Mastercard Cloud-Based Payment tokens, the Dual Message Authorization System performs appropriate cryptographic data pre-validation, and maps the token to the primary account number.
4. If the cryptography validation and PAN mapping are successful, the Dual Message Authorization System then sends the issuer the authorization request.
5. The issuer responds with an authorization response message, and the Dual Message Authorization System maps the PAN back to the token and provides the response to the acquirer.
6. The acquirer forwards the token and other authorization response information to the contactless terminal or merchant payment gateway.
7. The Dual Message Authorization System logs all authorizations for which it performed MDES services and makes this information available to the Dual Message Clearing System.

### Process flow for static tokens

1. The cardholder initiates a transaction with a token.
2. For electronic commerce (e-commerce) transactions using static tokens, the acquirer initiates an authorization request containing the token and DE 22, subfield 1.

**NOTE: For static tokens, cryptography data is not present in transactions.**

3. The Dual Message Authorization System maps the token to the PAN.
4. If the cryptography validation and PAN mapping are successful, the Dual Message Authorization System then sends the issuer the authorization request.
5. The issuer responds with an authorization response message, and the Dual Message Authorization System maps the PAN back to the token and provides the response to the acquirer.
6. The acquirer forwards the token and other authorization response information to the contactless terminal or merchant payment gateway.
7. The Dual Message Authorization System logs all authorizations for which it performed MDES services and makes this information available to the Dual Message Clearing System.

### Suspended or deactivated tokens

When a token has been suspended or deactivated from use, Mastercard will permit these transactions to pass through to the issuer for clearing. If the cardholder disputes the transaction, the issuer can chargeback under message reason code 4808 (Requested/Required Authorization Not Obtained). This process is consistent with that applied for non-token

transactions. Mastercard will not block the transaction in clearing but rather allow the dispute resolution process to occur. For transactions including a token, Mastercard will not enforce an error indicating the PAN is invalid and will allow the deactivated or suspended tokens to pass through clearing.

## Identifying issuer account ranges with IPM MPE

The IPM MPE table can identify issuer account ranges that participate in the Mastercard Digital Enablement Service. IPM MPE table IP0040T1: Issuer Account Range contains the Mapping Service Indicator field. This field identifies issuer account ranges that require MDES with value C (Mastercard Digital Enablement Service Account Range).

Mastercard adds the applicable MDES token account ranges to the IPM MPE before generating tokens for use in smart devices. The IPM MPE file contains valid Dual Message Clearing System Product IDs, country codes, and other fields necessary for processing for these account ranges. They are assigned to participate in all the default interregional, intraregional, and intracountry business services that are relevant to their assigned country codes.

**NOTE: If an issuer account range contains a value of C in the Mapping Service Indicator field in the IPM MPE, acquirers must send ALL transactions involving this issuer account range to Mastercard for authorization and clearing because only the Mastercard systems contain the data needed to map an MDES token to a PAN. Transactions processed in an On-Us or intraprocessor mode will not have access to this mapping data.**

## Identifying Mastercard Digital Enablement Service mapping within IPM messages

This section identifies MDES mapping within IPM messages.

### Contents of PDS 0001 (Mastercard Mapping Service Account Number)

The Dual Message Clearing System provides PDS 0001 (Mastercard Mapping Service Account Number) in any message in which it maps between an MDES token and a PAN.

### PDS 0001, subfield 2 (Account Number)

PDS 0001 (Mastercard Mapping Service Account Number), subfield 2 (Account Number) technical details are listed here.

Subfield 2 contains a token or a PAN. When issuers receive PDS 0001, subfield 2 always contains a token. When acquirers receive PDS 0001, subfield 2 always contains a PAN.

This subfield is 6-19 digits in length.

## PDS 0001, subfield 1 (Account Number Type)

Technical details about PDS 0001 (Mastercard Mapping Service Account Number), subfield 1 (Account Number Type).

Position 1 of this subfield contains

- Value C if the number in subfield 2 is an MDES secure element token
- Value H if the number in subfield 2 is an MDES Cloud-Based Payments token
- Value O if the number in subfield 2 is a static token, or
- Value T if the account number in subfield 2 is a PAN.

Position 2 of this subfield contains a space if the Dual Message Clearing System performed the mapping service according to the authorization logs. It contains a C if the Dual Message Clearing System performed the mapping service according to a source other than the authorization logs (This position will contain a C in all retrieval and chargeback messages).

Values for this subfield are listed in the following table.

### PDS 0001, subfield 1 (Account Number Type) Values

| Value   | Description                                                                                                                                                                   |
|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| C Space | Subfield 2 contains the MDES token used at the point of sale. The issuer owns the account range. Mapping was based on the authorization log.                                  |
| CC      | Subfield 2 contains the MDES token used at the point of sale. The issuer owns the account range. Mapping was based on a source other than the authorization log.              |
| H Space | Subfield 2 contains the MDES token used at the point of sale. The issuer owns the account range. Mapping was based on the authorization log.                                  |
| TC      | Subfield 2 contains a PAN. Mapping was based on a source other than the authorization logs.                                                                                   |
| O       | Subfield 2 contains the MDES Card on File token submitted by the acquirer. Mastercard owns the account range. Mapping was based on the authorization log.                     |
| OC      | Subfield 2 contains the MDES Card on File token submitted by the acquirer. Mastercard owns the account range. Mapping was based on a source other than the authorization log. |

## Processing First Presentment/1240 Messages through the Mastercard Digital Enablement Service Mapping Service

When processing a First Presentment/1240, the Dual Message Clearing System validates the contents of DE 2 (Primary Account Number [PAN]) against IPM MPE table IP0040T1.

If the Mapping Service Indicator field in table IP0040T1 indicates that DE 2 contains a service-eligible MDES token (indicated by a value of C in the Mapping Service Indicator field):

1. The Dual Message Clearing System first attempts to match to the MDES authorization log according to the combination of MDES token and Banknet Reference Number and date. If the token PAN mapping information is identified, it removes the banknet reference number.
2. If the Dual Message Clearing System does not find a match in the MDES authorization log, the Dual Message Clearing System attempts to match to the PAN Mapping database using the MDES token in DE 2.
3. If the Dual Message Clearing System cannot match the First Presentment/1240 message, the Dual Message Clearing System rejects the transaction.
4. The Dual Message Clearing System validates and when incorrect, rejects the First Presentment/1240 message containing PDS 0052 (Electronic Commerce Security Level Indicator), subfield 1 (Security Protocol), subfield 2 (Cardholder Authentication), and subfield 3 (UCAF Collection Indicator) values if they do not match the correct security level indicator (SLI) value in DE 48 (Additional Data: Private Use), subelement 42 (Electronic Commerce Indicators), subfield 1 (Electronic Commerce Security Level Indicator and UCAF Collection Indicator) from the Authorization Request Response/110 message.

**NOTE: The Dual Message Clearing System can continue its validation including comparing data points to what occurred in dual message authorization processing.**

After successfully mapping the MDES token to the PAN, the Dual Message Clearing System uses the PAN in its processing. It uses business services in which the issuer of the PAN participates, and it delivers the transaction to the endpoint associated with the issuer of the PAN, as opposed to the MDES token. If the transaction contains no errors, the Dual Message Clearing System modifies the data before sending the First Presentment/1240 to the issuer by:

- Moving the MDES token from DE 2 to PDS 0001 (Mastercard Mapping Service Account Number), subfield 2 (Account Number)
- Populating DE 2 with the PAN, and
- Passing through the value received from the acquirer in DE 22 (POS [POS] Entry Mode), subfield 7 (Card Data, Input Mode).

The Dual Message Clearing System also logs the mapped transaction to an MDES First Presentment history file. Any acknowledgment reconciliation messages or reporting created for the acquirer is based on the MDES token. Any notification reconciliation messages or reporting created for the issuer is based on the PAN.

If the transaction is rejected for any existing Dual Message Clearing System error, the Dual Message Clearing System sends the rejected transaction back to the acquirer with the acquirer's originally submitted values in DE 2 and DE 22.

# Processing First Chargeback/1442 messages through the Mastercard Digital Enablement Service

For First Chargeback/1442 messages, the Dual Message Clearing System attempts to match the PAN in DE 2 to the MDES First Presentment history file. If a match is found, the Dual Message Clearing System maps the cardholder's PAN to the token before sending the message to the acquirer.

The Dual Message Clearing System attempts to match to the history file using the following fields.

## Matching criteria for chargebacks

| The Dual Message Clearing System attempts to match this combination of fields in the chargeback message... | To this combination of fields in the MDES First Presentment history file |
|------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------|
| DE 2 (Primary Account Number)                                                                              | PAN                                                                      |
| DE 31 (Acquirer Reference Data)                                                                            | DE 31                                                                    |
| DE 30 (Amounts, Original) subfield 1 (Original Amount, Transaction)                                        | DE 4 (Amount, Transaction)                                               |
| PDS 0149 (Currency Codes, Amounts, Original), subfield 1 (Currency Code, Original Transaction Amount)      | DE 49 (Currency Code, Transaction)                                       |
| DE 12 (Date and Time, Local Transaction), subfield 1 (Date)                                                | DE 12, subfield 1                                                        |

If the mapped chargeback transaction contains no errors, the Dual Message Clearing System modifies the data before sending the message to the acquirer by:

- Moving the PAN from DE 2 to PDS 0001 (Mastercard Mapping Service Account Number), subfield 2 (Account Number),
- Populating DE 2 with the MDES token, and
- Populating DE 94 (Transaction Originator Institution ID Code) and DE 33 (Forwarding Institution ID Code) with customer ID information related to the MDES token.

When the Dual Message Clearing System logs the First Chargeback/1442 message to its existing chargeback history files, it logs both the primary account number and the MDES token. Any acknowledgment reconciliation messages or reports created for the issuer are based on the PAN. Any notification reconciliation messages or reports created for the acquirer are based on the MDES token.

If DE 2 in the First Chargeback/1442 message cannot be matched to a First Presentment/1240 message in the MDES First Presentment history file, the Dual Message Clearing System assumes that it did not perform MDES at the time of the First Presentment/1240 message.

The Dual Message Clearing System continues processing the First Chargeback/1442 message and delivers the message to the acquirer with the PAN in DE 2. If, upon receipt, the acquirer does not recognize the transaction because the First Presentment/1240 message had actually been submitted with an MDES token, the acquirer must follow existing dispute resolution rules and procedures that apply when the PAN is not recognized.

## Processing Second Presentment/1240 Messages through the Mastercard Digital Enablement Service

Details about the processing of Second Presentment/1240 messages through MDES are described here.

The acquirer populates DE 2 (Primary Account Number [PAN]) with the MDES token in the Second Presentment/1240. The Dual Message Clearing System attempts to match all Second Presentment/1240 messages to the existing Chargeback history file. If the Dual Message Clearing System is unable to match the message to the Chargeback history file, it rejects the Second Presentment/1240.

If the Dual Message Clearing System successfully matches the Second Presentment/1240 to the Chargeback history file, and the Chargeback history file indicates that DE 2 contains an MDES token, the Dual Message Clearing System maps it to the PAN and uses the PAN in its processing. For example, it uses business services in which the issuer of the (PAN) participates, and it delivers the transaction to the endpoint associated with the issuer of the PAN as opposed to the MDES token. If the transaction contains no errors, the Dual Message Clearing System modifies the data before sending the Second Presentment/1240 to the issuer by:

- Moving the MDES token from DE 2 to PDS 0001 (Mastercard Mapping Service Account Number), subfield 2 (Account Number)
- Populating DE 2 with the PAN

Any acknowledgment reconciliation messages or reports created for the acquirer are based on the MDES token. Any notification reconciliation messages or reports created for the issuer are based on the PAN.

## Processing Fee Collection/1740 Messages through the Mastercard Digital Enablement Service

Fee Collection/1740 messages initiated with MDES tokens: The acquirer populates DE 2 (Primary Account Number [PAN]) with the service-eligible MDES token in the Fee Collection/1740.

The Dual Message Clearing System validates the contents of DE 2 against IPM MPE table IP0040T1, as usual. If the Mapping Service Indicator field in table IP0040T1 indicates that DE 2 contains a service-eligible MDES token, the Dual Message Clearing System maps the MDES token in DE 2 to the PAN using the MDES First Presentment history file.

If the Dual Message Clearing System cannot match the Fee Collection/1740 message to the MDES First Presentment history file, the Dual Message Clearing System rejects the transaction.

After successfully mapping the MDES token to a PAN, the Dual Message Clearing System uses the PAN in its processing. For example, it uses business services in which the issuer of the PAN participates, and it delivers the transaction to the endpoint associated with the issuer of the PAN, as opposed to the MDES token. If the transaction contains no errors, the Dual Message Clearing System modifies the data before sending the message to the issuer by:

- Moving the MDES token from DE 2 to PDS 0001 (Mastercard Mapping Service Account Number), subfield 2 (Account Number), and
- Populating DE 2 with the PAN.

Any acknowledgment reconciliation messages or reports created for the acquirer are based on the MDES token. Any notification reconciliation messages or reports created for the issuer are based on the PAN.

Fee Collection 1740/messages initiated with the PAN: The issuer populates DE 2 with the PAN in the Fee Collection/1740 message. The Dual Message Clearing System attempts to match the PAN in DE 2 to the MDES First Presentment history file. If a match is found, the Dual Message Clearing System will map the cardholder's PAN to the MDES token before sending the message to the acquirer. If the Dual Message Clearing System cannot match the Fee Collection/1740 message to the First Presentment history file, the Dual Message Clearing System will continue processing the Fee Collection/1740 message as a non-PAN mapped transaction. DE 2 in the Fee Collection/1740 message to the acquirer will contain the PAN.

## Elements related to the Mastercard Digital Enablement Service

This table summarizes the contents of the elements that are affected when the Dual Message Clearing System performs MDES processing.

### Contents of MDES Elements

| Clearing Message       | Scenario                    | DE 2  | PDS 0001, Subfield 2 | DE 22, subfield 7                                                              | DE 94 and DE 33                        |
|------------------------|-----------------------------|-------|----------------------|--------------------------------------------------------------------------------|----------------------------------------|
| First Presentment/1240 | From acquirer to Mastercard | Token | Not present          | A, B, M, R, S, or T                                                            | As provided by the acquirer            |
|                        | From Mastercard to issuer   | PAN   | Token                | A, B, M, R, S, or T                                                            | As provided by the acquirer            |
| Retrieval Request/1644 | From issuer to Mastercard   | PAN   | Not present          | As provided by the issuer                                                      | As provided by the issuer              |
|                        | From Mastercard to acquirer | Token | PAN                  | A, B, M, R, S, or T if the issuer provided other DE 22 values in the retrieval | Customer IDs associated with the token |

| Clearing Message                            | Scenario                    | DE 2  | PDS 0001, Subfield 2 | DE 22, subfield 7           | DE 94 and DE 33                        |
|---------------------------------------------|-----------------------------|-------|----------------------|-----------------------------|----------------------------------------|
| Fee Collection (Retrieval Fee Billing)/1740 | From acquirer to Mastercard | Token | Not present          | DE 22 not in message layout | As provided by the acquirer            |
|                                             | From Mastercard to issuer   | PAN   | Token                | DE 22 not in message layout | As provided by the acquirer            |
| First Chargeback/ 1442                      | From issuer to Mastercard   | PAN   | Not present          | A, B, M, R, S, or T         | As provided by the issuer              |
|                                             | From Mastercard to acquirer | Token | PAN                  | A, B, M, R, S, or T         | Customer IDs associated with the token |
| Second Presentment/ 1240                    | From acquirer to Mastercard | Token | Not present          | A, B, M, R, S, or T         | As provided by the acquirer            |
|                                             | From Mastercard to issuer   | PAN   | Token                | A, B, M, R, S, or T         | As provided by the acquirer            |
| Arbitration Chargeback/ 1442                | From issuer to Mastercard   | PAN   | Not present          | A, B, M, R, S, or T         | As provided by the issuer              |
|                                             | From Mastercard to acquirer | Token | PAN                  | A, B, M, R, S, or T         | Customer IDs associated with the token |

## Interchange compliance processing

MDES service is performed for First Presentment/1240 messages, which are analyzed during the interchange compliance process.

As described in the *Mastercard Network Processing Dual Message Authorization System Guide*, transactions for which the Dual Message Authorization System performs the MDES service do not contain magnetic stripe data when they are sent to the issuer and logged by the Dual Message Authorization System. Therefore, U.S.-acquired First Presentment/1240 messages for which Mastercard performs the MDES service may not pass the magnetic stripe quality test within the interchange compliance process. This test requires validation of the magnetic stripe presence at the time of the authorization for specific incentive interchange programs, unless the transaction is exempt.

Mastercard modified the interchange compliance magnetic stripe quality test to exempt transactions in which PDS 0001 (Mastercard Mapping Service Account Number) is present in the First Presentment/1240 message. The presence of PDS 0001 indicates that Mastercard performed a PAN mapping; and therefore, magnetic stripe data is not expected to be present in the authorization message.

## Mastercard Transaction Calculator

Mastercard Transaction Calculator derives the applicable interchange program based on acquirer-submitted clearing data.

### High-level process overview

The following is a high-level overview of how the interchange program is derived by Mastercard Transaction Calculator and applied to acquirer-submitted clearing data:

1. The acquirer sends PDS 0158 (Business Activity), subfield 4 (Interchange Rate Designator) in the First Presentment/1240-200 clearing message with a value present or equal to space (blank).
2. Once Mastercard Transaction Calculator is enabled, Mastercard applies the applicable interchange program on behalf of customers based on customer-provided transaction data, within the First Presentment/1240-200 messages.
  - If the acquirer populates PDS 0158, subfield 4 with an interchange program value, Mastercard updates the value with the interchange program qualified under Mastercard Transaction Calculator.

### Service requirements for acquirers

Mastercard Transaction Calculator is currently enabled in select markets. For additional information, review the *Mastercard Transaction Calculator Product Guide* on the Technical Resource Center or contact Customer Support.

## Mastercom and Claims Manager

This section provides an overview of Mastercom and its components.

### Mastercom overview

Issuers and acquirers use Mastercom to resolve disputed transactions by participating in Mastercom Collaboration and by creating chargebacks, second presentments, and cases as part of the dispute cycle.

**IMPORTANT: To use Mastercom and participate in the dispute resolution process, issuers and acquirers are required to have at least one Mastercom user account.**

Mastercom helps facilitate efficient sharing of information and documentation during the dispute cycle to determine which party has financial responsibility for disputed transactions.

### Claims Manager overview

Mastercom Claims Manager offers complete end-to-end functionality for processing and managing disputes.

Claims Manager groups dispute events related to a single first presentment under a single claim, allowing issuers and acquirers to track the progress of the claim through the dispute resolution cycle. Claims Manager groups the claims into queues according to their progress in the dispute resolution cycle.

Claims Manager supports the following use cases for Dual Message System disputes:

| Entity             | Use case                                                                                                                                                                                                                                                                                                                                                      |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Issuer             | <ul style="list-style-type: none"><li>• Research a first presentment and open a claim.</li><li>• Create a Collaboration request manually (claims for transactions involving U.S. healthcare only)<sup>20</sup></li><li>• Create a first chargeback.</li><li>• Receive a second presentment.</li><li>• Create a pre-arbitration or arbitration case.</li></ul> |
| Acquirer           | <ul style="list-style-type: none"><li>• View claims created by the issuer.</li><li>• Receive and respond to a Collaboration request.</li><li>• Receive a first chargeback.</li><li>• Create a second presentment.</li><li>• Receive a pre-arbitration or arbitration case.</li></ul>                                                                          |
| Issuer or acquirer | <ul style="list-style-type: none"><li>• Add supporting documentation to a dispute event.</li><li>• Create a pre-compliance or compliance case.</li><li>• Send and receive a fee collection message.</li><li>• Generate reports.</li></ul>                                                                                                                     |

## Multiple clearing messages

An acquirer has the option of linking multiple presentments with partial amounts to one approved authorization identified as either a preauthorization or final authorization.

For detailed information on this process, please refer to the *Transaction Processing Rules*.

<sup>20</sup> If the issuer is not direct to Ethoca, Claims Manager automatically creates Collaboration requests when an issuer creates a first chargeback.

Mastercard Network Processing Dual Message Clearing System Guide— • 4 November 2025

2129

## Payment Cancellation Service

Payment Cancellation Service enables issuers to have Mastercard block unwanted card-not-present (CNP) transactions acquired on the Dual Message Authorization System and Dual Message Clearing System.

This includes issuers of Mastercard credit cards, Debit Mastercard, non-Mastercard Maestro, and other card products, such as private label. Payment Cancellation is available in the United States for issuers distributing non-Mastercard Maestro Cards.

Issuers use Payment Cancellation Service by sending a request to the Payment Cancellation Service database containing information identifying the cardholder's Primary Account Number (PAN), acquirer institution ID, merchant ID, and optionally, the transaction amount or transaction amount range. Additionally, in the United States, non-Mastercard Maestro CNP transactions the customer can request to block by Payment Facilitator and Sub Merchant ID as an alternative to merchant ID. Mastercard checks the Payment Cancellation Service database for entries, and CNP transactions are declined when a match is found during authorization and clearing. Once Mastercard blocks the transaction, future charges do not appear on the cardholder statement avoiding the costly chargeback process and helps to ensure a positive cardholder experience.

Issuers cannot use Payment Cancellation Service to stop a transaction after providing an authorization approval for the same transaction. If an issuer believes that an authorized transaction is fraudulent, the issuer must allow the transaction to clear. The issuer may then use the Mastercard chargeback process to have the transaction investigated.

This service helps global users to safeguard against payments which are no longer authorized and comply with national payment regulations.

For more information, refer to the *Payment Cancellation Program Guide*.

## Private Label Program

This section describes the Private Label Program that offers customers a superior private label transaction processing solution.

### Overview

The Private Label Program uses the existing Mastercard payment system infrastructure to provide authorization, clearing, and settlement services for private label card transactions, in addition to improved products and services that issuers may use, along with their private label programs.

These services are provided exclusively for transactions originating from the approved private label card portfolios of Mastercard issuers.

For more information, refer to the *Private Label Program Guide for Acquirers* or *Private Label Program Guide for Issuers*.

## Private Label addendum

Private Label Program participants require equivalent data when using Private Label processing that they receive in their closed-loop processing model.

The two addenda messages that support the Private Label Program are:

- Private Label Common Data, which supports data fields common to the transaction
- Private Label Line Item Detail, which supports data fields specific to the individual items being purchased and included in the transaction

The Private Label Common Data and Private Label Line Item Detail addenda messages are optional for Private Label First Presentment/1240 messages. The Private Label Common Data addendum message is conditionally required if the Private Label Line Item Detail addendum message is provided. In addition, the Private Label Common Data addendum message must precede the Private Label Line Item Detail addendum message. If the Private Label Common Data or Private Label Line Item Detail addendum messages are submitted and rejected, the corresponding First Presentment/1240 message is not rejected.

For more information on the layouts for the Private Label Common Data and Private Label Line Item Detail addendum messages, refer to [Data element definitions and details](#).

## Private Label card activation plus initial load

Mastercard has expanded the existing card activation at the point-of-sale terminal (POS) functionality to allow card activation messages to be submitted with an initial load. Customers can offer this functionality, making private label cards more attractive to their merchants, by enabling activation of prepaid cards with or without a predefined amount.

Acquirers that want to offer the private label card activation plus initial load functionality must be able to support and send value C09 (Card Activation) for PDS 0043 (Transaction Type Identifier) in First Presentment/1240 messages.

Issuers that want to offer the private label card activation plus initial load functionality must be able to support and receive value C09 for PDS 0043 in First Presentment/1240 messages.

## Mastercard Transaction Enablement Service

Mastercard Transaction Enablement Service (TES) is an optional service that ensures the correct submission of certain Data Elements (DEs) or Private Data Subelements (PDSs) by correcting DEs or PDSs on behalf of acquirers.

Acquirers participating in TES may obtain various benefits, including reduced settlement delays and operational impacts associated with the management of clearing rejects. Also, acquirers that would like to receive reconciliation report data associated with TES can request it from Mastercard.

Mastercard will make the reconciliation data available to acquirers through the raw data file upon request through Global Customer Support. The file contains the data elements and

subelements originally submitted by acquirers and were subsequently adjusted by the Dual Message Clearing System as a result of participating in the service. This file will only be sent to acquirers when First Presentment (1240-200) messages clear successfully.

## Service Requirements for Acquirers

All acquirers configuring new ICA number are automatically enrolled unless they choose to opt out at the time of onboarding.

However, the raw data file, IP714010-AA (Acquirer Accepted Errors Detail Report), containing reconciliation data from TES will be available to acquirers only by request.

**NOTE: TES is an opt-out service in Brazil.**

## Processing Message Exception/1644-691 messages through the Mastercard Transaction Enablement Service

This section describes processing message exceptions through TES.

### Contents of PDS 0445 (Original Transaction Information)

PDS 0445 (Original Transaction Information) contains one or more data elements (DE) and private data subelements (PDS) echoing the transaction information that was submitted by acquirers and adjusted by TES.

For more information, refer to [PDS 0445 \(Original Transaction Information\)](#)

## MCC Adjustments in Brazil

For acquirers participating in TES, Mastercard adjusts the submitted DE 26 (Acceptor Business Code [MCC]) within Brazilian intracountry First Presentment/1240-200 messages.

If the MCC submitted by the acquirer is not valid for the Merchant Tax ID provided in PDS 0220 (Brazil Merchant Tax ID), Mastercard will replace it with a valid MCC to ensure that the transaction is not rejected with Dual Message Clearing System error 3007.

When Mastercard rejects the original First Presentment for a reason other than error code 3007, Mastercard will return the message with an updated DE 26 (Acceptor Business Code [MCC]) value in First Presentment/1240-200 message and the originally submitted DE 26 value in PDS 0445 (Original Transaction Information) within the Message Exception/1644-691 message that accompanies the reject. For example, a customer submits MCC code (DE 26) 1234 to Mastercard in the First Presentment/1240-200 message and it is not valid for the Brazil Merchant Tax ID. When Mastercard applies TES, the MCC value is updated with 5678. Later in the process, the message is rejected with a different error code and must be returned to the acquirer.

Mastercard will include adjusted MCC 5678 in DE 26 within the First Presentment/1240-200 message, and the original, acquirer-provided MCC 1234 in PDS 0445 within the Message

Exception/1644-691 message in the T112 and T113 files. Refer to [PDS 0445 \(Original Transaction Information\)](#) for more information..

**NOTE: As a result of the MCC adjustment, the Dual Message Clearing System may derive an interchange fee amount that differs from the amount originally expected by the acquirer. This can occur because TES may modify the MCC but will not change the IRD. As a result, Dual Message Clearing System interchange overrides that are based on the MCC will be affected by the adjusted MCC.**

The Associação Brasileira das Empresas de Cartões de Crédito e Serviços (ABECS), of which Mastercard is an associated member, is enabling public access to their CNPJ/TAX ID and MCC database. ABECS will make updates to their CNPJ/TAX ID and MCCs database on the last business day of every month. In turn, Mastercard will provide the following one month for acquirers and processors to make their database updates as needed before changes are effective in Mastercard systems.

Accordingly, the effective date for changes or rejections due to incorrect MCCs will be the first of the month, based on data updates from the prior month. For example:

#### Example

| Step   | Description                                                                                                                        | Date                                                      |
|--------|------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------|
| Step 1 | ABECS updates the database on the last business day of the month, which may or may not be the last calendar day of the month.      | Friday, September 29, 2023                                |
| Step 2 | ABECS provides the following month for acquirers and Mastercard to make updates to their databases.                                | Sunday, October 1, 2023 through Tuesday, October 31, 2023 |
| Step 3 | Clearing messages will be validated and modified by Mastercard using the latest updates made during the prior month by Mastercard. | Wednesday, November 1, 2023                               |
| Step 4 | The process repeats monthly.                                                                                                       |                                                           |

**NOTE: Mastercard is not responsible for the timing, availability, and content of the data made available on the ABECS website at <https://www.abecs.org.br/consulta-mcc-individual>. ABECS has sole discretion to alter the data as needed.**

## TES adjusts MCC in DE 26 and the message clears successfully

1. The acquirer submits a First Presentment/1240-200 message through the R111 bulk file for processing.
2. Dual Message Clearing System performs the Brazil Merchant Tax ID/MCC validation and it fails.
3. TES adjusts the MCC to a value corresponding to the Brazil Merchant Tax ID present in the First Presentment message.
4. Dual Message Clearing System performs the remaining edit validations and all edit validations pass.
5. Dual Message Clearing System passes the First Presentment/1240-200 to the Brazil issuer with the updated MCC.
6. If the Brazil acquirer opts to receive the report (IP714010-AA), then it will be sent to them.

## TES adjusts the MCC in DE 26 and the message is rejected

1. The acquirer submits a First Presentment/1240-200 message through the R111 bulk file for processing.

2. Dual Message Clearing System performs the Brazil Merchant Tax ID/MCC validation and it fails.
3. TES adjusts the MCC to a value corresponding to the Brazil Merchant Tax ID that was present in the first presentment message.
4. Dual Message Clearing System performs the remaining edit validations. One other validation fails, causing the message to be rejected.
5. Dual Message Clearing System rejects the First Presentment/1240-200 message.
6. TES populates the original MCC in PDS 0445 within the Message Exception/1644-691 message and the adjusted MCC in DE 26 within the First Presentment/1240-200 message.
7. Dual Message Clearing System sends this information either in T112 or T113 depending on the acquirer's participation in T113.

# Appendix D Transaction research

*A transaction research request is a request by a customer for Mastercard to provide information about a transaction.*

---

|                                                            |      |

A customer submits a transaction research request to Mastercard when they need information about a transaction. This section outlines available methods to perform research and information about Transaction Investigator.

## Performing a transaction research request

Customers can use either of the following two methods to research information about previous transactions:

- Transaction Investigator tool to conduct research about specific transactions or a range of transactions for an account number. The report generated provides customers with transactional data such as card number, card validation code 2 (CVC 2) response, point-of-sale entry mode, cardholder present information, merchant advice code, and message type identifier (MTI). This tool allows customers to conduct research about specific transactions or a range of transactions for an account number.
- Customers can also contact the Global Customer Service team for assistance. To request this service, customers must complete the *Clearing Transaction Research Request* (Form 949) found on Mastercard Connect.

## Capabilities of the Transaction Investigator tool

The Mastercard Transaction Investigator tool enables users to complete a variety of unique tasks. The Mastercard Transaction Investigator tool allows users to search the Mastercard data warehouse for first presentment transactions that a customer has processed either as an acquirer or an issuer.

This capability:

- Provides secure access to proprietary clearing information
- Retrieves relevant transaction data elements online with the option to view all available data elements for a transaction message type
- Returns the data within seconds after the customer electronically submits the request for research

In addition, users can print the transaction data or export the information into a Microsoft Excel file.

The transaction data is stored in the Mastercard data warehouse and is available to customers for three years. Most transactions are available within 24 hours of the transaction time.

To access the Transaction Investigator Tool, customers must be licensed users of Mastercard Connect.

## Registering for Transaction Investigator

To register for the Transaction Investigator tool:

### Procedure

1. Log on to Mastercard Connect at [www.mastercardconnect.com](http://www.mastercardconnect.com).
2. Enter your **User ID** and **Password**.
3. On the Connect homepage main menu, click **Store**.
4. Scroll or search for **Transaction Investigator**.

5. Click **Add to Shopping**.  
A confirmation message displays.
6. Click **Cart** to display the cart.
7. Click **Checkout** to display the **Order Details** window.
8. Under **Order Details**, click **Review Order**.
9. Review the order and **Place Order**.

Once the Security Administrator approves the request, Transaction Investigator displays under the Applications menu on the Mastercard Connect homepage.

**NOTE: For any assistance with Mastercard Connect enrollment or product registration, contact Global Customer Support at [customer\\_support@mastercard.com](mailto:customer_support@mastercard.com).**

## Accessing and using the Transaction Investigator tool

To access the Transaction Investigator tool and view clearing summaries and details

### Procedure

1. Log on to Mastercard Connect using your Mastercard Connect user ID and SecurID.
2. From the Applications menu, click **Transaction Investigator**.

A new browser window opens and displays the Transaction Investigator home page.

**NOTE: Users can perform searches on this screen using a combination of account number and dates, or Auth only data.**

3. To search for clearing transaction data using additional criteria, click **Advanced Search**.
4. Select the criteria.
5. Select **Clearing View** on the left pane.  
A summary of clearing information displays based on the criteria entered in the search.
6. To expand the data elements that contain subfield data, click the corresponding plus sign.  
The subfield data is highlighted for the expanded data element.

## Setting user preferences

You can set user preferences to customize the display of information in each panel within the Transaction Investigator.

### Procedure

1. From the panel tool bar, click the **Customize**.
2. From the Customize window, select the data elements that you want to hide from view.
3. Click the **Move Left** arrow to move the selected data elements to the **Hidden from View** panel.

4. To change the display order of data elements, select the desired data element in the **My View** panel and click the **Up** or **Down** arrow .
5. Click **Save**.
6. To display all the data elements, click **Restore Default**.
7. Click **Search** after entering the cardholder's account number and the date range results to display results.  
The **Clearing Detail** displays the details corresponding to the highlighted transaction in the Clearing Summary grid.

## Global Collection-Only data in Transaction Research

Global Collection-Only data consists of Collection-only transactions neither issued nor acquired in the United States. A GCO transaction is a transaction that is cleared and settled outside the Mastercard Dual Message system.

This would include transactions that are either:

- acquired and issued by the same customer (On-Us)
- acquired and issued by customers processing through the same processor (intraprocessor)

When a collection-only transaction occurs, the transaction is sent to Mastercard's Global Collection Management System with a settlement indicator (PDS165S01) value C to indicate collection-only.

When the Global Collection Only option is selected, a query in Transaction Research searches for GCO transactions from the GCO data store. The Clearing summary and details grids display the GCO transaction records.

## Appendix E Transaction data classifications table

This section provides details on the transaction data classifications for the Dual Message Clearing System.

Category One: Transaction data that, when received by a customer or Service Provider, must only be used, or disclosed by the customer or Service Provider for the purpose of carrying out the customer's issuing program, acquiring program, or digital activities (for example, as relating to digital wallets and tokenization).

Category Two: Transaction data that, when received by a customer or Service Provider, must only be used, or disclosed in connection with the specific purpose for which it was provided (for example, as relating to participation in a program or service).

### Data element transaction data classifications

| Data element | Data element description                               | Category |
|--------------|--------------------------------------------------------|----------|
| DE 1         | Bit Map, Secondary                                     | One      |
| DE 2         | Primary Account Number [PAN]                           | One      |
| DE 3         | Processing Code                                        | One      |
| DE 3         | Subfield 1 (Cardholder Transaction Type Code)          | One      |
| DE 3         | Subfield 2 (Cardholder Account Type [From])            | One      |
| DE 3         | Subfield 3 (Cardholder Account Type [To])              | One      |
| DE 4         | Amount, Transaction                                    | One      |
| DE 5         | Amount, Reconciliation                                 | One      |
| DE 6         | Amount, Cardholder Billing                             | One      |
| DE 7         | Transmission Date and Time                             | One      |
| DE 8         | Amount, Cardholder Billing Fee                         | One      |
| DE 9         | Conversion Rate, Reconciliation                        | One      |
| DE 10        | Conversion Rate, Cardholder Billing                    | One      |
| DE 12        | Date and Time, Local Transaction                       | One      |
| DE 14        | Date, Expiration                                       | One      |
| DE 22        | Point of Service Entry Mode                            | One      |
| DE 22        | Subfield 1 (Terminal Data, Card Data Input Capability) | One      |

| Data element | Data element description                                         | Category |

## Fee collection overview

The Global Clearing Management System collects all fees through fee collection messages. This includes retrieval fee billing transactions, as well as all other fee types.

The combination of message type indicator (MTI), DE 24 (Function Code), and DE 25 (Message Reason Code) in the fee collection message indicates the fee that is being collected.

Fee collection messages are IPM messages used for the collection or disbursement of fees that require funds settlement between various payment parties. These messages include fees generated between pairs of customers and fees generated between Mastercard and customers.

**NOTE: Mastercard does not provide or validate history for fee collection messages, although the sender may optionally provide it.**

## Fee collection messages for retrieval fee billing

Customers are allowed to submit IPM Fee Collection (Retrieval Fee Billing)/1740 messages for specific document types.

Acquirers may not submit IPM Fee Collection (Retrieval Fee Billing)/1740 messages for

- Document type 2 (copy) and
- Document type 4 (substitute draft).

However, customers may continue to submit these messages for document type 1 (hard copy original document) at a rate of USD 15 each.

Fees for document types 2 (copy) and 4 (substitute draft) are collected through the Mastercard Consolidated Billing System (MCBS). The Mastercard electronic imaging system does not generate any fulfillment fee IPM messages or records.

Mastercard applies a tiered rate structure to fulfillment fee messages (applies to types 2 and 4), depending on the type of document and number of days for fulfillment.

## Fee collection messages for purposes other than retrieval fee billing

Customers must settle all miscellaneous fees and charges by use of the IPM Fee Collection/1740 message. The fee collection message is used for a number of diverse applications, and it contains the information required for customers to process the miscellaneous fees and charges identified in DE 25 (Message Reason Code).

Within the IPM Fee Collection/1740 message, DE 25 indicates the reason for, or type of, fee collection. DE 3 (Processing Code), subfield 1 (Cardholder Transaction Type) indicates the

direction of funds movement, such as debit to message originator or credit to message originator.

## Presenting the Fee Collection/1740 message

The message originator must submit the entire Fee Collection/1740 message with function code 700, providing the appropriate information for each element.

The message originator always must provide a control number for returns and resubmissions and must retain the control number for audit trail purposes. The message originator provides this control number in PDS 0137 (Fee Collection Control Number). The contents of PDS 0137 are assigned at the discretion of the message originator.

If the fee collection message requires supporting documentation, the message originator must mail the documentation according to the instructions on the specific ICA form or as specified in this chapter. The message originator should clearly note the PDS 0137 value on all of the documentation to allow the receiving customer to readily match the documentation to the applicable message and transaction.

If the transaction amount exceeds the U.S. dollar maximum for each message reason code, an additional message or messages reflecting the same DE 25 (Message Reason Code) value should be submitted for the excess amount.

**NOTE: Transaction amount maximum can be set in currencies other than U.S. dollar. All Fee Collection/1740 message with function code 700 transaction amount maximum settings can be viewed in the IPM MPE Table IP0097T1: Message Reason Code Restrictions for Card Program Identifier and Business Service Arrangement.**

## Returning and resubmitting the Fee Collection/1740 message

Reference these tables and figures for information regarding returning and resubmitting the Fee Collection/1740 message and the values that may be entered in DE 24 (Function Code).

Customers may return or resubmit a fee collection message by sending a Fee Collection/1740 message with one of these DE 24 values.

- 700 = First Submission
- 780 = Return
- 781 = Resubmission
- 782 = Arbitration Return

### Submitting the Fee Collection/1740 Message

1. The receiving customer may return a fee collection within 45 calendar days after receipt of the message for any of the following reasons. This is handled by sending a Fee Collection/1740 with the same data originally received, except that DE 24 must contain a value of 780 to indicate a return.
  - Supporting documentation not received. The receiving customer must wait 21 calendar days from the date the message is received before returning for this reason.
  - Missorted to wrong member.
  - The message text was not provided or was incomplete.
  - Fee charged exceeds amount allowed.
  - Fee inaccurate because of entry error.
  - Charged twice for same fee.
  - Past applicable time frame.
  - An erroneous or inappropriate progressive handling fee was received.
  - Unauthorized fee/charge: receiving member did not approve or agree to accept fee/charge. Applicable only to reason codes for good-faith acceptance (DE 25 = 7606) and for collection letters (DE 25=7607).
2. If a fee collection is returned for any of the previously-mentioned reasons, the receiving customer may resubmit it within 45 calendar days of receipt of the message but only if the

reason for return has been corrected (For example, the receiving customer has supplied the missing documentation or the correct amount). To resubmit the fee collection, the customer sends a Fee Collection/1740 with a DE 24 value of 781 to indicate a resubmission. The customer should indicate an explanation of the correction in DE 72 (Data Record).

3. If a fee collection is improperly resubmitted, it may be returned within 45 calendar days of receipt of the message, using the arbitration return. Before returning the fee collection for missing documentation, the receiving customer must wait 21 calendar days from the date the customer receives the message. To return the fee collection, the customer sends a Fee Collection/1740 with a DE 24 value of 782 to indicate an arbitration return. The customer should indicate an explanation in DE 72.

Mastercard does not permit a third submission (the second submission being in step 2, above). Any remaining unsolved disputes concerning the fee collection message may be pursued by the customer through a compliance case filing with Mastercard.

**NOTE: For case filings initiated for a violation of this subsection, the good-faith correspondence is not required. For more information about filing procedure, refer the *Chargeback Guide*.**

The sending customer must reverse any Fee Collection/1740 message that is duplicated in error. The customer handles this by processing a duplicate of the message originally processed, except that the customer enters the letter R in PDS 0025 (Message Reversal Indicator), subfield 1 (Message Reversal Indicator). This denotes a reversal transaction.

**NOTE: For more information about reversals, refer to the Reversals chapter of the *Global Clearing Management System Reference Manual*.**

## Reason codes for fee collection

The following tables describe the DE 25 (Message Reason Code) values that apply to fee collection messages.

## Global Clearing Management System minimal rounding

Global Clearing Management System rounds to the number of positions specified by the currency exponent.

- After Global Clearing Management System calculates a cash disbursement fee
- After Global Clearing Management System completes the calculation of acquirer and issuer payment amounts in acquirer/issuer payment currency
- After Global Clearing Management System completes the calculation of a cardholder billing amount
- After Global Clearing Management System completes the calculation of an interchange fee in issuer/acquirer payment currency

**NOTE: When Global Clearing Management System converts the transaction amount in transaction currency to the (euro) issuer/acquirer payment currency, Global Clearing Management System first converts the amount to the base currency (USD), and carries six positions to the right of the decimal (no rounding). Then Global Clearing Management System converts the USD base amount to the euro, and rounds to the euro currency exponent.**

Global Clearing Management System only rounds amounts to the number of positions to the right of the decimal point specified by the currency exponent, once they are calculated in the final (issuer/acquirer payment currency, cardholder billing currency) currency, as shown in the following table.

**Global Clearing Management System minimal rounding to currency exponent**

| <b>IF Global Clearing Management System has...</b>       | <b>THEN Global Clearing Management System rounding to the nearest currency exponent...</b>                                   |
|----------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------|
| Calculated interchange <b>fees in payment currencies</b> | Occurs after Global Clearing Management System has completed calculation of the interchange fee in acquirer/issuer currency. |
| Calculated an <b>Acquirer/Issuer payment</b>             | Occurs after Global Clearing Management System has completed calculation of the acquirer/issuer payment amount.              |
| Calculated a <b>Cardholder billing amount</b>            | Occurs after Global Clearing Management System has completed calculation of the cardholder billing amount.                   |

## Fee Collection Return/1740–780 and Fee Collection Arbitration Return/1740–782

This table describes the DE 25 (Message Reason Code) values that apply to Fee Collection Return/1740–780 and Fee Collection Arbitration Return/1740–782 messages.

**NOTE: Transaction amount maximum can be set in currencies other than U.S. dollar. All Fee Collection/1740 message transaction amount maximum settings can be viewed in the IPM MPE Table IP0097T1: Message Reason Code Restrictions for Card Program Identifier and Business Service Arrangement. For example, the maximum amount for MRC 7601 for Europe intraregional business services for MCC and DMC acceptance brand is EUR 115.**

| <b>DE 25</b>   | <b>7600</b>                                                                                                                                      |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
|                | Lost/stolen telex/phone fee; for collection of lost stolen report fee and phone or telex costs incurred for taking a lost or stolen card report. |
| Maximum Amount | USD 65                                                                                                                                           |

|                |                                                                                                                                     |        |                                                                                                                                                                |

## Appendix G Determination and validation of business service

*This appendix defines how Mastercard determines interchange applied to clearing messages.*

---

|                                                                                                                                               |      |
|-----------------------------------------------------------------------------------------------------------------------------------------------|------|
| Data and message content validation by Global Clearing Management System.....                                                                 | 2210 |
| Step 1: validate the elements used in the selection process.....                                                                              | 2210 |
| Step 1a: validate format requirements.....                                                                                                    | 2210 |
| Step 1b: validate syntax/attribute of selection elements.....                                                                                 | 2211 |
| Step 1c: validate content of selection elements.....                                                                                          | 2212 |
| Step 2: determine whether the transaction requires business service processing.....                                                           | 2213 |
| Step 3: business service arrangement selection.....                                                                                           | 2214 |
| Step 3a (standard process): retrieve and match card program identifier and business service arrangement participation.....                    | 2214 |
| Step 3b (central acquiring process): retrieve and validate issuer card program identifier and business service arrangement participation..... | 2215 |
| Global Clearing Management System validation of business service arrangement.....                                                             | 2217 |
| Step 4: validate the message reason code and reversal indicator for the card program identifier/business service arrangement combination..... | 2218 |
| Step 5: validate the processing code and reversal indicator for the card program identifier/business service arrangement combination.....     | 2219 |
| Step 6: determine whether IRD validation is required for the transaction.....                                                                 | 2220 |
| Interchange rate designator (IRD) validation.....                                                                                             | 2220 |
| Step 7: validate the processing code and reversal indicator for the IRD.....                                                                  | 2220 |
| Step 8: validate product codes for the IRD.....                                                                                               | 2221 |
| Step 9: validate AB programs for the IRD.....                                                                                                 | 2223 |
| Step 10: validate transaction currency for the business service.....                                                                          | 2224 |
| Step 11: check for intracountry business service overrides.....                                                                               | 2224 |
| Enforcement of business service arrangements.....                                                                                             | 2225 |
| Default business service arrangements.....                                                                                                    | 2226 |
| Life cycle processing supported by Global Clearing Management System.....                                                                     | 2226 |
| Global Clearing Management System edits, fee assignments, and fee calculation.....                                                            | 2229 |

## Using the MPE to select the card program identifier and business service information

The Dual Message Clearing System can select or validate the business activity (PDS 0158, subfields 1-4) for all financial transactions. The following outlines the steps that Dual Message Clearing System follows to select the business activity for financial transactions using the IPM Mastercard Parameter Extract (MPE). This includes selection or validation of the card program identifier, selection or validation of the business service arrangement, and validation of the interchange rate designator (IRD), if applicable.

| Step                                           | Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| 3b.                                            | Retrieve and Validate Issuer Card Program Identifier and Business Service Arrangement Participation (Central Acquiring Process)<br><br>Global Clearing Management System determines whether Central Acquiring logic applies to an intra-European or inter-European transaction by comparing the acquiring BIN country code (found in table IP0041T1) with the merchant country code (found in DE 43 [Acceptor Name/Location], subfield 6 [Acceptor Country Code] of the transaction). If these country codes are the same, the Standard Process (defined in Step 3a above) applies. If the country codes are not the same, the Central Acquiring Process applies, as defined in this subsection. |
| <b>Business Service Arrangement Validation</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| 11.  | Determine whether the issuer account range is exempt from Central Acquiring |

The following diagrams depict the flow:

### Data and message content validation

## Business service arrangement selection and validation

## IRD validation

## Data and message content validation by Global Clearing Management System

These steps describe the process of validating the data and message content.

### Step 1: validate the elements used in the selection process

Certain elements must be present and valid in each message to begin the process of selecting the card program identifier and business service arrangement. These are the elements used to validate the qualification criteria for card program identifiers and business service arrangements.

The format requirements, syntax/attribute definitions, and content of these critical elements are defined by Mastercard.

#### Step 1a: validate format requirements

Global Clearing Management System validates that all the elements necessary for selection are present and valid using Table IP1102T1 Mandatory Field Edits.

The columns in the figure that follows show the elements used in the selection process. The rows in this figure show whether each of these elements is mandatory, conditional, or optional for each transaction function.

**Table IP1102T1 format requirements for elements used in selection**

| Msg Type/ Message Reason Code | MTI | DE2 | DE3 | DE24 | DE25 | DE26 | DE31 | DE43 | DE93 | DE94 | PDS0025* | PDS0026* | PDS0158 | PDS0165 |

\*Message Reversal and File Reversal Indicators are present only if the message or file is a reversal.

If one of the elements shown in the previous figure is mandatory for a message but not present, Global Clearing Management System rejects the message with the following error message (where <fldname> represents the name of the missing element):

735 - <fldname> MUST BE PRESENT

## Step 1b: validate syntax/attribute of selection elements

Global Clearing Management System edits the syntax/attribute requirements for all the elements used in the selection process.

- IP0006T1 Data Element Attributes
- IP0007T1 Data Element Subfield Attributes
- IP0008T1 PDS Attributes
- IP0009T1 PDS Subfield Attributes

<sup>21</sup> All of the above elements may not be present in all messages.

## Step 1c: validate content of selection elements

Global Clearing Management System edits the content of the elements to ensure the values submitted are valid system values.

| Name                                        | Element           | Table Name                                                                 | Table ID |
|---------------------------------------------|-------------------|----------------------------------------------------------------------------|----------|
| PAN                                         | DE 2              | Issuer Account Range Table                                                 | IP0040T1 |

| Acceptor Country Code                       | DE 43, subfield 6 | Country Codes Table                                                        | IP0028T1 |
| Transaction Destination Institution ID Code | DE 93             | Expanded Customer ID Master Table                                          | IP0072T1 |
| Transaction Originator Institution ID Code  | DE 94             | Expanded Customer ID Master Table                                          | IP0072T1 |
| Message Reversal Indicator                  | PDS 0025          | PDS 0025 Message Reversal Indicator, subfield 1 Message Reversal Indicator | IP2059T1 |

The IP2nnnT1 series tables contain valid values based on card program identifier/business service arrangement combination. They contain some entries for which the Card Program Identifier field contains all spaces and the Business Service Arrangement Type and Business Service ID fields contain all zeros. These entries represent the default valid values. At this stage of validation, when Global Clearing Management System is trying to ensure that all of the mandatory fields are present and contain valid values, Global Clearing Management System uses these default valid values.

<sup>22</sup> The table includes acceptor business codes that are active and life cycled. If the AB code provided by the customer is in life cycle status, First Presentment/1240 non-reversal messages will be rejected.

Later, after Global Clearing Management System assigns a specific card program identifier/business service arrangement combination, Global Clearing Management System may perform edits that require a specific subset of valid values depending on the business service. For these types of edits, Global Clearing Management System uses the IP2nnnT1 table entries that contain specific values in the Card Program Identifier, Business Service Arrangement Type, and Business Service ID fields.

## Step 2: determine whether the transaction requires business service processing

Not all messages require business service processing. Table IP0092T1 identifies the transaction functions that are eligible for business service processing. If the switch in the table is equal to Y for the transaction function, Global Clearing Management System performs business service processing.

Mastercard defines the following as the specific transaction functions that are eligible.

| MTI  | Function Code (DE 24)   | Description                                                                             | Requires Business Service Processing Switch |
|------|-------------------------|-----------------------------------------------------------------------------------------|---------------------------------------------|
| 1240 | 200                     | First Presentments                                                                      | Y                                           |
| 1644 | 695                     | File Trailer                                                                            | N                                           |
| 1644 | 696                     | Financial Detail Addendum (inherits business service from associated First Presentment) | N                                           |
| 1644 | 697                     | File Header                                                                             | N                                           |
| 1442 | 450, 453                | First Chargebacks                                                                       | Y                                           |
| 1240 | 205, 282                | Second Presentments                                                                     | Y                                           |
| 1442 | 451, 454                | Arbitration Chargebacks                                                                 | Y                                           |
| 1644 | 603                     | Retrieval Requests                                                                      | Y                                           |
| 1740 | 700, 780, 781, 782, 783 | Fee Collections                                                                         | Y                                           |
| 1740 | 790                     | Fee Collection Fund Transfer                                                            | Y                                           |

## Step 3: business service arrangement selection

There are two processes for selecting business service arrangements.

### Step 3a (standard process): retrieve and match card program identifier and business service arrangement participation

Global Clearing Management System retrieves the card program identifier and business service arrangement participation information for both customers in the message.

| To Retrieve Card Program Identifier and Business Service Arrangement Participation Combinations for the... | Use Element                      | Table Name                                                                                  | Table ID |
|------------------------------------------------------------------------------------------------------------|----------------------------------|---------------------------------------------------------------------------------------------|----------|
| Issuer (applies to Presentments, Chargebacks, and Fee Collection Retrieval Fee Billing messages)           | DE 2 (expanded to 19 positions)  | Issuer Account Range Card Program Identifier and Business Service Arrangement Participation | IP0090T1 |
| Acquirer (applies to Presentments, Chargebacks, and Fee Collection Retrieval Fee Billing messages)         | DE 31, subfield 2                | Acquiring BIN Card Program Identifier and Business Service Arrangement Participation        | IP0091T1 |
| Receiver (applies only to Fee Collection messages other than Fee Collection Retrieval Fee Billing)         | DE 93 (expanded to 11 positions) | Customer Business Service Arrangements                                                      | IP0056T1 |
| Sender (applies only to Fee Collection messages other than Fee Collection Retrieval Fee Billing)           | DE 94 (expanded to 11 positions) | Customer Business Service Arrangements                                                      | IP0056T1 |

Using the tables listed above, Global Clearing Management System finds all card program identifier/business service arrangement combinations in common between the two customers.

If none are in common, Global Clearing Management System rejects the transaction.

If the two customers have one or more card program identifier/business service arrangement combinations in common, Global Clearing Management System evaluates each card program identifier/business service arrangement combination that is in common between the customers against the characteristics of the transaction. This process begins with Step 4 as described in the Business Service Arrangement Validation subsection later in this section. If one arrangement fails the validation, Global Clearing Management System returns to Step 3a to evaluate the next higher priority issuer card program identifier/business service arrangement combination.

## Step 3b (central acquiring process): retrieve and validate issuer card program identifier and business service arrangement participation

Central acquiring logic applies only to presentments, chargebacks, and ATM withdrawal transactions for which the issuer, the acquirer, and the acceptor are in the Europe region. Central acquiring logic does not apply to manual cash advance transactions, balance inquiries, PIN unlock, or PIN change.

For central acquiring, the acquiring bank identification numbers (BINs) do not show all the relevant intracountry business service arrangements in table IP0091T1. Such an approach would be too restrictive for acquirers as they would need to wait until they were set up in table IP0091T1 for a new intracountry arrangement before they could successfully submit transactions in that market. Therefore, for central acquiring situations, Global Clearing Management System considers only the issuing account range participation as defined in table IP0090T1.

Global Clearing Management System determines whether central acquiring logic applies to an intra-European transaction by comparing the acquiring BIN country code (found in table IP0041T1) with the merchant country code (found in DE 43 [Acceptor Name/Location], subfield 6 [Acceptor Country Code] of the transaction). If these country codes are the same, the standard process (defined in Step 3a above) applies. If the country codes are not the same, the central acquiring process applies, as defined in this subsection.

For the central acquiring process, Global Clearing Management System retrieves the card program identifier and business service arrangement participation information for the issuer only.

| To Retrieve Card Program Identifier and Business Service Arrangement Participation Combinations for the... | Use Element                     | Table Name                                                                                  | Table ID |
|------------------------------------------------------------------------------------------------------------|---------------------------------|---------------------------------------------------------------------------------------------|----------|
| Issuer (applies to presentments and chargebacks)                                                           | DE 2 (expanded to 19 positions) | Issuer Account Range Card Program Identifier and Business Service Arrangement Participation | IP0090T1 |

Global Clearing Management System then evaluates each card program identifier/business service arrangement combination in which the issuer participates, in the sequence in which they are provided in table IP0090T1, to determine whether the acquirer accepts the card program identifier, and whether the geography and Central Acquiring permission are appropriate.

To determine whether the acquirer accepts the card program identifier of the card program identifier/business service arrangement combination being evaluated, Global Clearing Management System checks all the table IP0041T1 entries for the acquiring BIN. If the contents of the Card Program Identifier field in any of the acquiring BIN table IP0041T1 entries match the card program identifier of the card program identifier/business service arrangement combination being evaluated, Global Clearing Management System considers the arrangement eligible for further processing. Otherwise, Global Clearing Management System discards the

Determination and validation of business service  
Step 3b (central acquiring process): retrieve and validate issuer card program identifier and  
business service arrangement participation

current arrangement and returns to Step 3b to evaluate the next higher priority issuer card program identifier/business service arrangement combination.

**NOTE: Table 94 is called only when the business service level equals 4 Intra or 3 Inter. It is not called for M2M.**

To validate the geography of the arrangement, Global Clearing Management System looks up the issuer's card program identifier/business service arrangement combination in table IP0094T1 Geographic Restrictions. Table IP0094T1 restricts business service arrangements at either the country code level or the region level.

If table IP0094T1 has no entry for the card program identifier/business service arrangement combination, Global Clearing Management System considers the card program identifier/business service arrangement combination to have no geographic restrictions and, therefore, it is eligible for further processing.

If table IP0094T1 has at least one entry for the card program identifier/business service arrangement combination, the business service arrangement combination has at least one geographic restriction. Global Clearing Management System evaluates each of these entries to ensure that the transaction meets at least one of the table IP0094T1 geographic restrictions as follows:

- If the table IP0094T1 entry contains a country code in the Country field, Global Clearing Management System compares the merchant country code (found in DE 43, subfield 6 of the transaction) with the Country field in table IP0094T1.
- If the table IP0094T1 entry contains a region code on the Region field, Global Clearing Management System determines the region associated with the merchant country code of the transaction and compares it with the Region field in table IP0094T1.
- If the merchant country or region matches the table IP0094T1 country or region, Global Clearing Management System considers the card program identifier/business service arrangement combination eligible for further processing.
- If none of the table IP0094T1 entries for the business service arrangement matches the merchant country/region of the transaction, Global Clearing Management System discards the current arrangement and returns to Step 3b to evaluate the next higher priority issuer card program identifier/business service arrangement combination.

If the issuer arrangement being evaluated is not a Customer-to-Customer arrangement, Global Clearing Management System evaluates the issuer card program identifier/business service arrangement combination against the characteristics of the transaction. This process begins with Step 4 as described in the Business Service Arrangement Validation subsection later in this section.

If the arrangement fails the validation, Global Clearing Management System returns to Step 3b to evaluate the next higher priority issuer card program identifier/business service arrangement combination. If the issuer arrangement being evaluated is a Customer-to-Customer arrangement, Global Clearing Management System continues its Central Acquiring process by validating acquirer participation in this customer-to-customer business service arrangement. Global Clearing Management System does this by looking up the combination of Acquirer

Reference ID, Customer-to-Customer business service arrangement, and card program identifier in table IP0091T1.

If no matching entry is in table IP0091T1, the acquirer does not participate in the Customer-to-Customer business service arrangement; therefore, it cannot be used. Global Clearing Management System discards the current Customer-to-Customer business service arrangement and returns to Step 3b to evaluate the next higher priority issuer card program identifier/business service arrangement combination. If a matching entry is in table IP0091T1 for the Customer-to-Customer business service arrangement, Global Clearing Management System continues its Central Acquiring process by validating Central Acquiring permission. To do this, Global Clearing Management System looks up the issuer's Customer-to-Customer business service arrangement in table IP0089T1 Business Service Switches.

- If the table IP0089T1 entry contains a Y in the Central Acquired Switch field, the Customer-to-Customer business service arrangement cannot be used, because an appropriate intracountry business service arrangement should be used instead for the centrally acquired transactions. Therefore, Global Clearing Management System discards the current Customer-to-Customer arrangement and returns to Step 3b to evaluate the next higher priority issuer card program identifier/business service arrangement combination.
- If the table IP0089T1 entry contains an N in the Central Acquired Switch field, or table IP0089T1 has no entry for the specified Customer-to-Customer business service arrangement, Global Clearing Management System evaluates this M2M business service arrangement against the characteristics of the transaction beginning with Step 4, within the Central Acquiring process. If current M2M fails validation, Global Clearing Management System returns to Step 3B.

## Global Clearing Management System validation of business service arrangement

Global Clearing Management System validates the qualification criteria for a card program identifier/business service arrangement combination.

If the transaction does not meet all of the qualification criteria for the arrangement, including criteria for the submitted IRD, Global Clearing Management System discards the current card program identifier/business service arrangement combination and returns to Step 3 to evaluate the next higher priority card program identifier/business service arrangement combination. This process continues until the transaction qualifies for an arrangement, or there are no more arrangements in common.

Global Clearing Management System evaluates business service arrangements according to the sequence in which the entries appear in the optimized table IP0090T1, because the entries are provided in this table in sequence by the correct priority. This process allows Global Clearing Management System to select the most appropriate card program identifier/business service combination for the transaction.

When the transaction satisfies all qualifying criteria for a card program identifier/business service arrangement combination, including IRD criteria, Global Clearing Management System

Determination and validation of business service

Step 4: validate the message reason code and reversal indicator for the card program identifier/  
business service arrangement combination

assigns this information to the message in private data subelement (PDS) 0158 (Business Activity).

**NOTE: Global Clearing Management System evaluates all original and reversal financial transactions, with the exception of global collection only transactions, against the qualification parameters for all eligible card program identifiers and business service arrangements unless otherwise noted.**

**NOTE: Global collection only transactions bypass all qualification criteria except for Message Reason Code validation. Selection of the card program identifier and business service arrangement for global collection only transactions is based only on issuing account range and Acquirer Reference ID (or sending and receiving customer ID) participation and priority, and message reason code validation.**

When Global Clearing Management System is unable to select an arrangement for the message or to validate the customer-submitted arrangement information in PDS 0158, Global Clearing Management System rejects the message. Global Clearing Management System generates a Message Exception/1644 message with an error code indicating the fields in error and the reason for the error. Global Clearing Management System generates one Message Exception/1644 message with one error code for each card program identifier and business service arrangement combination evaluated (Or if IRD validation is required for the message, Global Clearing Management System generates one Message Exception/1644 message with an error code for each card program identifier/business service arrangement/IRD combination evaluated).

## Step 4: validate the message reason code and reversal indicator for the card program identifier/business service arrangement combination

In some messages, such as First Presentment/1240 messages, DE 25 (Message Reason Code) is an optional field. If DE 25 is not present in the message, Global Clearing Management System performs this step using spaces for the message reason code.

Global Clearing Management System first looks up the combination of card program identifier, business service arrangement type, and business service ID in table IP0088T1 to determine whether it is masked to another business service arrangement.

- If table IP0088T1 has no entry that matches all of these values, the business service arrangement is not masked and Global Clearing Management System will perform all table lookups using the actual card program identifier and business service arrangement values.
- If table IP0088T1 has an entry that matches all of these values, Global Clearing Management System obtains the related masked card program identifier, masked business service arrangement type, and masked business service ID and will perform table IP0097T1 and IP0098T1 lookups using these masked values instead of the actual card program identifier and business service arrangement values.

Global Clearing Management System then looks up the combination of message type identifier (MTI), function code, message reason code, card program identifier, business service arrangement type, and business service ID, in table IP0097T1. When performing this lookup,

Determination and validation of business service  
Step 5: validate the processing code and reversal indicator for the card program identifier/  
business service arrangement combination

Global Clearing Management System uses the masked card program identifier and business service arrangement values if table IP0088T1 indicates that the business service arrangement is masked.

If table IP0097T1 has no entry that matches all of these values, Global Clearing Management System discards the current arrangement and returns to Step 3 to select the next card program identifier/business service arrangement combination.

If table IP0097T1 has an entry that matches all of these values, Global Clearing Management System obtains the value in the table IP0097T1 Reversal Indicator field.

- If this value is B, the table IP0097T1 entry is valid for both reversal and non-reversal transactions, and Global Clearing Management System continues processing with Step 5.
- If this value is R, the table IP0097T1 entry is valid only for reversal transactions. If the transaction is a reversal, indicated by PDS 0025 (Message Reversal Indicator), subfield 1 (Message Reversal Indicator) being present in the transaction and containing a value of R, Global Clearing Management System continues processing with Step 5. If the transaction is not a reversal, Global Clearing Management System discards the current arrangement and returns to Step 3 to select the next card program identifier/business service arrangement combination.
- If this value is N, the table IP0097T1 entry is valid only for non-reversal transactions. If the transaction does not contain PDS 0025, subfield 1 with a value of R, it is not a reversal and Global Clearing Management System continues processing with Step 5. Otherwise, Global Clearing Management System discards the current arrangement and returns to Step 3 to select the next card program identifier/business service arrangement combination.

## **Step 5: validate the processing code and reversal indicator for the card program identifier/business service arrangement combination**

Global Clearing Management System first looks up the value in DE 3 (Processing Code), subfield 2 (Cardholder From Account Type Code) of the transaction in table IP2054T1 and obtains its related masked value. The masked value is located immediately following the actual value. Global Clearing Management System will perform table IP0098T1 and IP0052T1 lookups using the masked DE 3, subfield 2 value in place of the actual DE 3, subfield 2 value.

Global Clearing Management System then looks up the combination of message type identifier (MTI), function code, processing code, card program identifier, business service arrangement type, and business service ID, in table IP0098T1. Global Clearing Management System uses the masked DE 3 and masked business service arrangement values where appropriate.

If table IP0098T1 has no entry that matches all of these values, Global Clearing Management System discards the current arrangement and returns to Step 3 to select the next card program identifier/business service arrangement combination.

If table IP0098T1 has an entry that matches all of these values, Global Clearing Management System obtains the value in the table IP0098T1 Reversal Indicator field.

- If this value is B, the table IP0098T1 entry is valid for both reversal and non-reversal transactions, and Global Clearing Management System continues processing with Step 6.

- If this value is R, the table IP0098T1 entry is valid only for reversal transactions. If the transaction is a reversal, indicated by PDS 0025 (Message Reversal Indicator), subfield 1 (Message Reversal Indicator) being present in the transaction and containing a value of R, Global Clearing Management System continues processing with Step 6. If the transaction is not a reversal, Global Clearing Management System discards the current arrangement and returns to Step 3 to select the next card program identifier/business service arrangement combination.
- If this value is N, the table IP0098T1 entry is valid only for non-reversal transactions. If the transaction does not contain PDS 0025, subfield 1 with a value of R, it is not a reversal and Global Clearing Management System continues processing with Step 6. Otherwise, Global Clearing Management System discards the current arrangement and returns to Step 3 to select the next card program identifier/business service arrangement combination.

## Step 6: determine whether IRD validation is required for the transaction

Global Clearing Management System looks at the table IP0098T1 entry found in Step 5 validation and checks the Requires IRD Validation Switch field.

- If this field contains Y, Global Clearing Management System performs IRD validation (beginning with Step 7) and determines the correct interchange fee using the IRD submitted in PDS 0158 (Business Activity), subfield 4 (Interchange Rate Designator) of the transaction.
- If this field contains N, Global Clearing Management System performs IRD validation (beginning with Step 8) and determines the correct interchange fee using an IRD value of spaces.

## Interchange rate designator (IRD) validation

The interchange rate designator (IRD) must be validated.

## Step 7: validate the processing code and reversal indicator for the IRD

If IRD validation is not required for the transaction, Global Clearing Management System omits Step 7 and continues processing with Step 8.

Otherwise, Global Clearing Management System looks up the combination of message type identifier (MTI), function code, processing code, card program identifier, business service arrangement type, business service ID, and interchange rate designator (IRD), in table IP0052T1. To perform this lookup, Global Clearing Management System uses

- the masked value for DE 3 (Processing Code), subfield 2 (Cardholder From Account Type Code), as described in Step 5

- the actual (unmasked) values for the card program identifier/business service arrangement combination, and
- The actual interchange rate designator in the IRD field.

If table IP0052T1 has no entry that matches all of these values, Global Clearing Management System discards the current arrangement and returns to Step 3 to select the next card program identifier and business service arrangement combination.

If table IP0052T1 has an entry that matches all of these values, Global Clearing Management System obtains the value in the table IP0052T1 Reversal Indicator field.

- If this value is B, the table IP0052T1 entry is valid for both reversal and non-reversal transactions, and Global Clearing Management System continues processing with Step 8.
- If this value is R, the table IP0052T1 entry is valid only for reversal transactions. If the transaction is a reversal, indicated by PDS 0025 (Message Reversal Indicator), subfield 1 (Message Reversal Indicator) being present in the transaction and containing a value of R, Global Clearing Management System continues processing with Step 8. If the transaction is not a reversal, Global Clearing Management System discards the current arrangement and returns to Step 3 to select the next card program identifier/business service arrangement combination.
- If this value is N, the table IP0052T1 entry is valid only for non-reversal transactions. If the transaction does not contain PDS 0025, subfield 1 with a value of R, it is not a reversal and Global Clearing Management System continues processing with Step 8. Otherwise, Global Clearing Management System discards the current arrangement and returns to Step 3 to select the next card program identifier/business service arrangement combination.

## Step 8: validate product codes for the IRD

Global Clearing Management System looks up the combination of card program identifier, business service arrangement type, business service ID, and interchange rate designator (IRD) in masked business services and interchange rate designators table (IP0087T1) to see whether it is masked to another business service arrangement and IRD.

Spaces are used in the IRD field for look-up when IRD validation is not required as described in Step 6.

- If there is no entry in table IP0087T1 that matches all of these values, the business service arrangement is not masked and Global Clearing Management System performs table IP0096T1 look-up using the actual card program identifier, business service arrangement type, business service ID, IRD, and Global Clearing Management System product ID values.
- If there is an entry in table IP0087T1 that matches all of these values, Global Clearing Management System obtains the related masked card program identifier, masked business service arrangement type, masked business service ID, masked interchange rate designator, and Global Clearing Management System product ID and performs table IP0096T1 look-up using these masked values instead of the actual card program identifier, business service arrangement, and IRD values.

**NOTE: Product code validation process is bypassed when the message is a life cycle transaction and the product reassignment switch on table IP0040T1 is set to Y or the message is a first presentment and the first presentment reassignment switch on table IP0040T1 is Y.**

Global Clearing Management System looks up the value in DE 2 (Primary Account Number) of the transaction in table IP0040T1 by finding the table entries for which the DE 2 PAN falls within the issuer account range: low and issuer account range: high values in table IP0040T1. There may be more than one entry in table IP0040T1 for the issuer account range. Global Clearing Management System chooses the table IP0040T1 entry for which the Card Program Identifier matches the card program identifier of the card program identifier/business service arrangement combination being evaluated. From this table IP0040T1 entry, Global Clearing Management System obtains the related Global Clearing Management System Product ID for use in table IP0096T1.

The product class feature provides the ability to vary interchange rates by product grouping, while maintaining common interchange structures. The product class override indicator is used in the interchange product override functionality. Override of interchange rates by product code is accomplished by assigning a product class override indicator to one or more product codes that would be associated with a given interchange rate value.

An example would be product class override indicator MCC (Consumer) being used to indicate a specific rate for a given IRD and product class override indicator. This product class override indicator MCC would be used for product codes MDS, MDH, MCE, MCC, MCG, MPL, and MDP, thereby avoiding the repetition of each of these product code rates in the appropriate tables in the member profile extract (MPE). This helps Mastercard to limit the number of entries in the MPE tables, reducing the delivery time to our customers.

Please refer to the *IPM Clearing Formats* manual to learn about the product class override indicator associated with each product code.

Global Clearing Management System looks up the combination of card program identifier, business service arrangement type, business service ID, IRD, and Global Clearing Management System product ID, in table IP0096T1. To perform this lookup, Global Clearing Management System uses

- the actual (unmasked) values for the card program identifier/business service arrangement combination or use masked values, if found
- the interchange rate designator in the IRD field (if IRD validation is required), or a space in the IRD field (if IRD validation is not required), as described in Step 6, and
- the Global Clearing Management System Product ID from table IP0040T1 in the product ID field.

| IF...                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | THEN...                                                                                                                                                                                                                                                                                                                         |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| There is no entry in table IP0096T1 that matches all the values mentioned in the previous bullet list                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Global Clearing Management System discards the current business service arrangement and returns to Step 3 to select the next card program identifier/business service arrangement combination.                                                                                                                                  |
| There is an entry in table IP0096T1 that matches all the values mentioned in the previous bullet list                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Global Clearing Management System proceeds to Step 9 to continue validating the IRD.                                                                                                                                                                                                                                            |
| There is an entry in table IP0096T1 that matches all the values mentioned in the previous bullet list, and <ul style="list-style-type: none"><li>the Card Program Identifier associated with this entry is other than CIR,</li><li>the transaction is an ATM transaction (DE 3 [Processing Code], subfield 1 [Cardholder Transaction Type], value of 1), and</li><li>at least one entry for this account range in table IP0040T1 contains a Global Clearing Management System Product ID of MCE, MEC, or MBE (denoting a Mastercard Electronic account range).</li></ul> | Global Clearing Management System discards the current business service arrangement and returns to Step 3 to select the next Card Program Identifier/Business Service Arrangement combination. This is because ATM transactions involving Mastercard Electronic cards must qualify for a business service that supports Cirrus. |

## Step 9: validate AB programs for the IRD

Global Clearing Management System looks up the value in DE 26 (Acceptor Business Code/MCC) of the transaction in table IP0075T1. There may be more than one entry in table IP0075T1 for the DE 26 value.

For each entry in table IP0075T1 applicable to the DE 26 value, Global Clearing Management System obtains the related acceptor business (AB) program for use in table IP0095T1.

Global Clearing Management System then looks up the combination of card program identifier, business service arrangement type, business service ID, interchange rate designator (IRD), and acceptor business (AB) program, in table IP0095T1. As with Step 8 (Validate product codes for the IRD), GCMS searches for a masked value in table IP0087T1. If found, Global Clearing Management System uses masked card program identifier, masked business service arrangement type, masked business service ID, and masked interchange rate designator if found in step 8. Spaces are used in the IRD field for look up when IRD validation is not required as described in Step 6.

If there is no entry in table IP0087T1 that matches all of these values, the business service arrangement is not masked, and the Global Clearing Management System performs table IP0095T1 look-up using the actual card program identifier, business service arrangement type, business service ID, IRD, and acceptor business (AB) program values.

If table IP0095T1 has an entry that matches all of these values, Global Clearing Management System proceeds to Step 10 to continue validating the business service.

Otherwise, Global Clearing Management System returns to table IP0075T1 and obtains the next table IP0075T1 entry for the DE 26 value and looks up its acceptor business (AB) program and business service/IRD information in table IP0095T1.

If Global Clearing Management System does not find an entry in table IP0095T1 that matches the business service arrangement/IRD and any one of the acceptor business (AB) programs in the relevant table IP0075T1 entries, Global Clearing Management System discards the current business service arrangement and returns to Step 3 to select the next card program identifier/business service arrangement combination.

## Step 10: validate transaction currency for the business service

Currently, Global Clearing Management System performs Step 10 only when both the issuer and acquirer are in the Europe region. However, this functionality could be made available, if needed, to customers in other regions.

Global Clearing Management System looks up the combination of card program identifier, business service arrangement type, and business service ID, in table IP0099T1. To perform this lookup, Global Clearing Management System uses the actual (unmasked) values for the card program identifier/business service arrangement combination.

- If table IP0099T1 has no entry for the business service arrangement, Global Clearing Management System proceeds to Step 11 to continue validating the business service.
- If table IP0099T1 has an entry for the business service arrangement, Global Clearing Management System obtains the value in the transaction currency code field and compares it to DE 49 (Currency Code, Transaction) in the message.

If the transaction currencies match, Global Clearing Management System proceeds to Step 11 to continue validating the business service.

Otherwise, Global Clearing Management System discards the current business service arrangement and returns to Step 3 to select the next card program identifier/business service arrangement combination.

## Step 11: check for intracountry business service overrides

Currently, Global Clearing Management System performs Step 11 only when both the issuer and acquirer are in the Europe region. However, this functionality could be made available, if needed, to customers in other regions.

For intracountry business services, Global Clearing Management System looks up the combination of business service arrangement type, business service ID, issuer account range: low, and issuer account range: high, in table IP0093T1. To perform this lookup, Global Clearing Management System uses

- the actual (unmasked) values for the business service arrangement combination, and
- the issuer account range: low and issuer account range: high fields from the relevant table IP0040T1 entry.

If table IP0093T1 has no entry that matches all of these values, Global Clearing Management System continues processing as described in the Edits and Fee Assignment section of this chapter.

If table IP0093T1 has an entry that matches all of these values and the Card Program Identifier of the card program identifier/business service arrangement being validated is MSI (Maestro) or CIR (Cirrus), Global Clearing Management System discards the current business service arrangement and returns to Step 3 to select the next card program identifier/business service arrangement combination.

If table IP0093T1 has an entry that matches all of these values and the Card Program Identifier being validated is other than MSI or CIR, Global Clearing Management System checks that the issuing account range country code (found in table IP0040T1) and the merchant country code (found in DE 43 [Acceptor Name/Location], subfield 6 [Acceptor Country Code] of the transaction) are the same.

- If so, Global Clearing Management System continues processing as described in the Edits and Fee Assignment subsection of this section.
- Otherwise, Global Clearing Management System discards the current business service arrangement and returns to Step 3 to select the next card program identifier/business service arrangement combination.

## Enforcement of business service arrangements

Mastercard will enforce the use of the business service arrangement for First Presentment/1240 and optionally life cycled transactions between acquirers and issuers.

If all customers in a country have agreed to participate in the pricing agreement, Mastercard is obliged to ensure that applicable transactions receive that pricing.

The business service selection enforcement code will be set to F (business service arrangement is mandatory for First Presentment/1240 messages) for designated business service arrangements.

This means that First Presentment/1240 transactions occurring between an Acquirer Reference ID and an issuer account range associated with the intracountry business service arrangements whose business service selection enforcement code has been set to F (mandatory business service arrangement) must be submitted for an interchange program that is valid for that intracountry business service arrangement.

If Global Clearing Management System processes a First Presentment/1240 transaction occurring between an acquirer and an issuer, and it is submitted with an IRD that does not qualify for the intracountry business service arrangement but qualifies for a less restrictive business service such as the regional business service arrangement, Global Clearing Management System will reject the transaction with error codes

- 2425: PDS 0158 (Business Activity), subfield 4 (Interchange Rate Designator) is not valid for enforced business service arrangement and acceptance brand ID code, and
- 2451: submitted business service arrangement is not valid. Must be submitted for enforced business service arrangement.

First Chargeback/1442, Second Presentment/1240, or Arbitration Chargeback/1442 transactions that contain an IRD that applies to the respective regional business service arrangement will still be permitted.

The business service selection enforcement code does not apply to the following transactions:

- Fee Collection/1740 messages. Existing functionality as it pertains to Fee Collection/1740 messages remains unchanged.
- Global collection only (On-Us and intraprocessor) transactions
- Transactions qualifying for an intracountry business service arrangement submitted with an airline acceptor business code (MCC in the range of 3000 to 3299)

Countries with established business service arrangements fall into one of two business service arrangement categories: default or non-default.

## Default business service arrangements

Intracountry business service arrangements have been set up in Global Clearing Management System. These arrangements are established as default, which means that all acquiring BINs and all issuing account ranges identified for this country are automatically included as participants.

Their participation in the enforced intracountry business service arrangement program will be finalized once the business service arrangement enforcement code has been updated from space (default value, not a mandatory business service arrangement) to F (mandatory business service arrangement).

## Life cycle processing supported by Global Clearing Management System

Global Clearing Management System supports life cycle activity processing when changes are made to certain system parameters or qualification parameters for card program identifiers, business service arrangements, and interchange rate designators (IRDs). This allows reversals and exception items such as chargebacks and retrievals to continue to be processed with the original settings, while new activity (such as First Presentment-originals) is processed using the new settings.

A life cycle indicator is associated with specific qualification parameters, which Global Clearing Management System uses to determine the valid messages (MTI/function code/processing code/reversal indicator combinations) for a given parameter. The life cycle indicator codes associated with each parameter are as follows.

| Code | Description                             |
|------|-----------------------------------------|
| A    | All transaction types are valid.        |
| L    | Only Life Cycle transactions are valid. |

A life cycle indicator parameter exists in the following IPM MPE tables and associated parameters.

| Table ID | Name                                                                                              | Life cycle indicator added to parameter                                                                                                                                                                |
|----------|---------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IP0036T1 | Default Business Service                                                                          | For combination of card program identifier/<br>business service arrangement type/business<br>service arrangement ID                                                                                    |
| IP0056T1 | Customer Business Service<br>Arrangement Participation                                            | For combination of card program identifier/<br>business service arrangement type/business<br>service arrangement ID/customer ID                                                                        |
| IP0075T1 | Acceptor Business Codes (MCCs)                                                                    | Acceptor Business Code                                                                                                                                                                                 |
| IP0075T1 | Acceptor Business Codes (MCCs)                                                                    | Acceptor Business Program                                                                                                                                                                              |
| IP0076T1 | Mastercard Assigned IDs                                                                           | Mastercard Assigned IDs                                                                                                                                                                                |
| IP0090T1 | Issuer Account Range Card<br>Program Identifier and Business<br>Service Arrangement Participation | For combination of card program identifier/<br>business service arrangement type/business<br>service arrangement ID/issuer account range-low/<br>issuer account range-high                             |

| Table ID | Name                                                                             | Life cycle indicator added to parameter                                                                                                                                        |
|----------|----------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IP0094T1 | Geographic Restrictions for Card Program Identifier/Business Service Arrangement | Region<br><br>For combination of card program identifier/business service arrangement type/business service arrangement ID                                                     |
| IP0095T1 | Acceptor Business Program Restrictions (new)                                     | Acceptor Business (AB) Program<br><br>For combination of card program identifier/business service arrangement type/business service arrangement ID/interchange rate designator |

When a parameter has a life cycle indicator of L, only life cycle transactions, as defined by Mastercard, are valid for the parameter value.

### Example

A business service arrangement has the following setup for AB programs:

#### AB program setup for business service arrangement 4/123456

| AB Program | Life Cycle Indicator |
|------------|----------------------|
| V001       | A = All              |
| A001       | L = Life Cycle Only  |

In the above example, the AB program value for A001 has a life cycle indicator value of L-life cycle only. In this instance, Global Clearing Management System will accept transactions that are defined as life cycle transactions only if the acceptor business code in DE 26 is assigned to the A001 AB program.

The following table indicates the transaction types that are defined by Mastercard as life cycle transactions:

| MTI  | Function Code | Processing Code      | Reversal Indicator            |
|------|---------------|----------------------|-------------------------------|
| 1240 | 200           | All Processing Codes | R                             |
| 1240 | 205           | All Processing Codes | All Reversal Indicator values |
| 1240 | 282           | All Processing Codes | All Reversal Indicator values |
| 1442 | 450           | All Processing Codes | All Reversal Indicator values |
| 1442 | 451           | All Processing Codes | All Reversal Indicator values |

| MTI  | Function Code | Processing Code      | Reversal Indicator            |
|------|---------------|----------------------|-------------------------------|
| 1442 | 453           | All Processing Codes | All Reversal Indicator values |
| 1442 | 454           | All Processing Codes | All Reversal Indicator values |
| 1644 | 603           | All Processing Codes | All Reversal Indicator values |
| 1740 | 700           | All Processing Codes | All Reversal Indicator values |
| 1740 | 780           | All Processing Codes | All Reversal Indicator values |
| 1740 | 781           | All Processing Codes | All Reversal Indicator values |
| 1740 | 782           | All Processing Codes | All Reversal Indicator values |

## Global Clearing Management System edits, fee assignments, and fee calculation

This section describes Global Clearing Management System edits, fee assignments, and fee calculation.

### Edits

The IP2nnT1 series tables contain valid values based on card program identifier/business service arrangement combination. After Global Clearing Management System assigns a specific card program identifier/business service arrangement combination, Global Clearing Management System may perform edits that require specific valid values depending on the business service. For these types of edits, Global Clearing Management System uses the IP2nnnT1 table entries that contain specific values in the card program identifier, business service arrangement type, and business service ID fields. Valid-value edits that are not specific to a business service arrangement are performed using the default values of spaces and zeros in the card program identifier/business service arrangement combination fields.

Global Clearing Management System also performs other edits, depending on the business service assigned, and does not use the IPM MPE for these edits.

If the transaction fails any edits, Global Clearing Management System rejects the transaction. Otherwise, Global Clearing Management System continues processing and determines the fees applicable to the transaction.

### Fee assignment

Global Clearing Management System looks up the transaction and business service information in table IP0052T1. Table IP0052T1 contains pointers to tables IP0053T1 and IP0057T1. Table IP0053T1 contains the fee groups that are assigned to the transaction. Table IP0057T1 contains override pointers to table IP0053T1.

Global Clearing Management System already looked up the card program identifier, business service arrangement type, business service ID, IRD, message type identifier (MTI), function code, and processing code information in table IP0052T1, in step 7 of this process. Global Clearing Management System now looks at the fee code pointer information in the table IP0052T1 entry.

If the IP0052T1 field Product Class: Acceptor Override Pointer contains all zeros, Global Clearing Management System disregards it and instead looks up the value from table IP0052T1 Fee Code Pointer in the Fee Code Pointer field in table IP0053T1. Global Clearing Management System then calculates the fees as described in the Fee Calculation section of this article.

If the IP0052T1 field product class: acceptor override pointer contains a non-zero value, it indicates that an override may exist for the interchange rate and represents a pointer to table IP0057T1.

Global Clearing Management System searches table IP0057T1 in accordance with the pointer obtained from table IP0052T1. Each pointer may have multiple entries. The multiple entries represent a number of different override rates that can be applied. On the basis of a predetermined hierarchy, Global Clearing Management System searches until the first matching entry is found. If no match is found, no override applies.

The criteria combinations are listed below in hierarchical order of selection:

1. The Mastercard Assigned ID, in combination with the product class and MCC
2. The Mastercard Assigned ID, in combination with the product class and acceptor business type
3. The Mastercard Assigned ID, in combination with the product class
4. The Mastercard Assigned ID, in combination with MCC
5. The Mastercard Assigned ID, in combination with the acceptor business type
6. The Mastercard Assigned ID
7. The product class, in combination with MCC
8. The product class, in combination with the acceptor business type
9. MCC
10. The acceptor business type
11. The product class

If Global Clearing Management System finds an entry in table IP0057T1 that matches the combination of one of the criteria listed in the hierarchy above, Global Clearing Management System then looks up the value from that table IP0057T1 entry's fee code pointer in the fee code pointer field in table IP0053T1. Global Clearing Management System then applies the appropriate rate types and calculates the fees as described in the Fee Calculation section of this manual.

If Global Clearing Management System does not find an entry in table IP0057T1 that matches the combination of one of the criteria listed in the hierarchy above, Global Clearing Management System uses the base rate. Global Clearing Management System then calculates the fees as described in the Fee Calculation section of this manual.

A refund service fee on European commercial transactions is applied a fixed percentage of the corresponding commercial purchase rate.

This will apply to all commercial refund transactions that are cleared within the European business service agreements (BSAs) having a value of Y in the exception rate override switch field in IPM MPE table IP0098T1.

Refunds on European commercial products will use the basis of product class override to look up the percentage that will apply to the commercial purchase rate.

If no match is found, no override applies and the Global Clearing Management System uses the base rate as the fixed percentage of the commercial purchase rate.

### Fee calculation

Table IP0053T1 contains multiple entries for the same fee code pointer. Each entry contains the payment party (issuer, acquirer, or internal entity), the interchange rate (if applicable) and rate direction, the interchange unit fee (if applicable) and its direction, the currency code and exponent for the unit fee (if applicable), and any minimum or maximum fee limits and direction.

#### NOTE:

**The IPM MPE file does not provide the rates and fees for all business service arrangements, because this information is proprietary. The business service arrangement and IRD parameters are stored in the IPM MPE file, but the fee code pointer and product class: acceptor override pointer fields in table IP0052T1 that normally point to the correct fee entries in tables IP0057T1, IP0053T1, or both, contain all zeros.**

The table IP0053T1 entries are grouped by rate type. For example, Rate Type 001 is the interchange fee and Rate Type 014 is the first-level corporate incentive discount (currently applies only to intra-European and inter-European transactions). For rate types other than 001, Global Clearing Management System determines whether to apply the fees according to internal programming logic. For example, Global Clearing Management System applies the Rate Type 014 first-level corporate incentive discount only if the transaction is accompanied by the required addendum elements. Participating customers understand the conditions in which the various rate types apply to business service arrangements in which they participate.

The rate types are as follows:

- 000: Cash Advance Fee (applies to manual cash disbursement transactions)
- 001: Interchange Fee
- 002: Merchant Investment Fee
- 003: Pay by Account Rate Adjustment Increase
- 004: Pay by Account Rate Adjustment Decrease
- 010: IVA on interchange fee (specific to Mexico processing)
- 013: ATM Late Presentment Fee (Currently specific to Europe processing. Applies to non-reversal First Presentment ATM transactions for which the transaction date is older than 45 days.

- 014: First-level Corporate incentive discount (applies when one corporate IRD can have different rates, depending on the presence of valid addendum data. Currently specific to Europe processing)
- 015: Purchase with Cash Back (applies only to the cash back portion of a purchase with cash back transaction)
- 016: Rewards Program
- 017: Second-level Corporate Incentive discount (applies when the transaction qualifies for neither the First-level Corporate incentive discount nor the U.K. Summary VAT Incentive discount, but the acquirer provides information in PDS 0502 [Custom Identifier]. Currently specific to Europe processing)
- 018: New UK Summary VAT Incentive Interchange (applies when the transaction does not qualify for the First-level Corporate Incentive discount, but the acquirer submits the data needed for Mastercard to generate the U.K. Summary VAT Invoice on behalf of the merchant. Required data is
  - PDS 0508 [Customer Code]
  - PDS 0596 [Acceptor Tax ID], in which subfield 1 [Acceptor Tax ID] contains the correct tax ID and subfield 2 [Acceptor Tax ID Provided Code] contains value Y
  - PDS 0597 [Total Tax Amount]
  - PDS 0600 [Acceptor Reference Number]
  - PDS 0641 [Product Code]
  - PDS 0642 [Item Description]
  - PDS 0647 [Extended Item Amount], with a non-zero value, and
  - PDS 0682 [Detail Tax Amount 1]).
- 019: Merchant Interchange
- 020: Europe Enhanced Value

# Appendix H Files and best practices

*The following appendix describes supporting files, messages and best practices that have not been otherwise described in detail within this guide.*

---

|                                                                                       |      |

## Record Descriptor Word at the beginning of IPM messages

A Record Descriptor Word (RDW) field appears before each IPM message.

The format of the data in both IPM clearing messages and IPM MPE messages (both full file and updates) is Variable Blocked Spanned (VBS). Therefore, messages may be longer than the Mastercard Network constraint of 1014 bytes. To accommodate customers delivering and receiving these messages over the Network and through Mastercard File Express, a four-byte Record Descriptor Word field immediately preceding each IPM message holds the length of the data in each message.

### Clearing Optimizer AutoEdit Software

The Clearing Optimizer AutoEdit software handles the Record Descriptor Word (RDW) in the IPM clearing messages and in the IPM MPE messages correctly. An RDW is present in all Variable Block Spanned (VBS) clearing files that Mastercard delivers to customers or receives from customers. The customer's method of file transfer determines how the customer must handle the files.

### MHPF MIP load and unload modules

The Member Host Preparation Facility (MHPF) MIP load and unload modules handle the RDW in the IPM clearing messages and in the IPM MPE messages correctly. Additional information may be found in the *File Transfer Manual* on Mastercard Connect.

### CONNECT:Direct

The Record Descriptor Word (RDW) does not affect customers that send or receive IPM clearing files, the IPM MPE file, or both through CONNECT:Direct.

### Mastercard Network through a MIP

This table defines what to do with the Record Descriptor Word (RDW) based on the communications software they use.

## Mastercard Network through a MIP

| IF a customer...                                                                    | AND the customer...                                      | THEN the customer...                                                                                                                                      |
|-------------------------------------------------------------------------------------|----------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| sends IPM clearing files through the network through a MIP                          | uses the Mastercard MHPF communications software         | Can handle the RDW by installing the optional JCL.<br><br>Job SMH1003R is the Customer Host Bulk Load for Variable Length Data Files.                     |
|                                                                                     | does not use the Mastercard MHPF communications software | Must delete then insert the RDW at the beginning of each IPM clearing message before loading the IPM clearing file to the MIP for delivery to Mastercard. |
| receives IPM clearing files, the IPM MPE, or both through the network through a MIP | uses the Mastercard MHPF communications software         | Can handle the RDW by installing the optional JCL.<br><br>Job SMH2003R is the Customer Host Bulk Unload for Variable Length Data Files.                   |
|                                                                                     | does not use the Mastercard MHPF communications software | Must remove the RDW from the beginning of each IPM clearing message, as the file is unloaded from the MIP.                                                |

## Notes on sending IPM files

IPM files may contain data from multiple customer IDs. The sending customer can submit transaction data for clearing seven days a week, 24 hours a day.

Customers may create and send clearing files as frequently as they want. Sending clearing files earlier allows customers to have more transactions processed in earlier clearing cycle cutoffs, thus ensuring the next available settlement of their accepted transactions.

Mastercard recommends that customers submit large files at least 30 minutes before the cutoff to ensure data is processed during the clearing period. Large files submitted close to the cutoff period may be deferred to the subsequent cycle, which could impact settlement timing. To avoid file processing delays, customers should dedicate sufficient time to prepare large files for submission 30 minutes prior to the cutoff.

A large file is a physical file with a record count greater than 1,000,000.

## Penalty for late Dual Message Clearing System retransmission requests

Customers that submit late Dual Message Clearing System retransmission requests are subject to an administrative fee.

If a customer is unable to process a Global Clearing Management System transmission and is connected to the Mastercard Network, the customer must restage the data and unload it again. If the customer is not connected to the Mastercard Network, the customer must immediately request a recreate of the transmission.

Satisfying late requests requires reprocessing in the Dual Message Clearing System. For this reason, Mastercard charges each customer that requests the transmission of data no longer available on the MIP. An administrative fee is charged per file of data requested. Refer to 2GC0001: Clearing Data Recreation fee in the *Pricing Guide* on the Pricing and Billing Resource Center.

## Customer clearing file delivery options

Customers have multiple options to choose from when receiving clearing data from the Dual Message Clearing System.

The Dual Message Clearing System provides several options for organizing incoming clearing data generated by Mastercard into separate files. The Dual Message Clearing System assigns different endpoints to different categories of data. An endpoint is a numeric, seven-digit identifier that is linked to a physical file delivery location defined by Mastercard.

The Dual Message Clearing System delivers one file to each endpoint after each clearing cycle in which a customer chooses to receive data.

File delivery options include:

- Customer ID
- Acquirer Reference ID
- Acquirer Reference ID plus card program identifier
- Issuer account range
- Issuer account range plus card program identifier
- Issuer account range plus card program identifier plus ATM versus POS

### Option 1: Customer ID

With this option, customers can specify different endpoints according to Customer ID. This table provides an example.

### Option 1: Customer ID example

| Customer ID | Endpoint |
|-------------|----------|
| 001234      | 0000001  |
| 005678      | 0000002  |
| 002222      | 0000001  |

In this example, Dual Message Clearing System will create one file for endpoint 0000001 and one file for endpoint 0000002 the closure of each clearing cycle.

The file created for endpoint 0000001 will contain transactions destined for customer IDs 001234 and 002222. The file created for endpoint 0000002 will contain transactions destined for Customer ID 005678.

A processor might choose to use this arrangement to group customers into different files.

### Option 2: Acquirer Reference ID

With this option, a customer can specify different endpoints according to the acquirer's bank identification number (BIN). This table provides an example.

### Option 2: Acquirer Reference Data example

| Acquirer Reference Data | Endpoint |
|-------------------------|----------|
| 541234                  | 0000001  |
| 543333                  | 0000002  |

In this example, Dual Message Clearing System will create one file for endpoint 0000001 and one file for endpoint 0000002 after each specified clearing cycle cutoff.

The file created for endpoint 0000001 will contain transactions destined for Acquirer Reference ID 541234. The file created for endpoint 0000002 will contain transactions destined for Acquirer Reference ID 543333.

### Option 3: Acquirer Reference ID plus card program identifier

With this option, a customer can specify different endpoints according to the combination of Acquirer Reference ID plus card program identifier. This table provides an example.

### Option 3: Acquirer Reference Data plus card program identifier example

| Acquirer Reference Data | Card Program Identifier | Endpoint |
|-------------------------|-------------------------|----------|
| 544444                  | Maestro (MSI)           | 0000001  |
| 544444                  | Mastercard (MCC)        | 0000002  |

In this example, Dual Message Clearing System will create one file for endpoint 0000001 and one file for endpoint 0000002 after each specified clearing cycle cutoff.

The file created for endpoint 0000001 will contain Maestro transactions destined for Acquirer Reference Data 544444. The file created for endpoint 0000002 will contain Mastercard transactions destined for Acquirer Reference Data 544444.

An acquirer might choose to use this arrangement to separate debit and credit activity.

### Option 4: Issuer account range

With this option, a customer can specify different endpoints according to the issuer account range. This table provides an example.

### Option 4: Issuer account range example

| Issuer Account Range | Endpoint |
|----------------------|----------|
| 541111               | 0000001  |
| 542222               | 0000002  |

In this example, Dual Message Clearing System will create one file for endpoint 0000001 and one file for endpoint 0000002 after each specified clearing cycle cutoff.

The file created for endpoint 0000001 will contain transactions destined for issuer account range 541111. The file created for endpoint 0000002 will contain Mastercard transactions destined for issuer account range 542222.

An issuer might choose to use this arrangement to separate consumer and corporate activity, by assigning consumer account ranges to one endpoint and corporate account ranges to another endpoint.

An issuer might also choose to use this arrangement to separate debit and credit activity, by assigning one endpoint to Maestro or Cirrus account ranges and another endpoint to Mastercard account ranges.

### Option 5: Issuer account range plus card program identifier

With this option, a customer can specify different endpoints based on the combination of issuer account range plus card program identifier. This table provides an example.

#### Option 5: Issuer account range plus card program identifier example

| Issuer Account Range | Card Program Identifier | Endpoint |
|----------------------|-------------------------|----------|
| 545555               | Cirrus (CIR)            | 0000001  |
| 545555               | Mastercard (MCC)        | 0000002  |

In this example, Dual Message Clearing System will create one file for endpoint 0000001 and one file for endpoint 0000002 after each specified clearing cycle cutoff.

The file created for endpoint 0000001 will contain Cirrus transactions destined for issuer account range 545555. The file created for endpoint 0000002 will contain Mastercard transactions destined for issuer account range 545555.

An issuer might choose to use this arrangement to separate Cirrus and Mastercard activity for each account range.

### Option 6: Issuer account range plus card program identifier plus ATM versus POS

With this option, a customer can specify different endpoints according to the combination of issuer account range, card program identifier, and whether the transaction is an ATM transaction. This table provides an example.

#### Option 6: Issuer account range plus card program identifier plus ATM versus POS example

| Issuer Account Range | Card Program Identifier | ATM/POS       | Endpoint |
|----------------------|-------------------------|---------------|----------|
| 545555               | Cirrus (CIR)            | ATM           | 0000001  |
| 545555               | Mastercard (MCC)        | Not specified | 0000002  |
| 547777               | Maestro (MSI)           | ATM           | 0000001  |
| 547777               | Maestro (MSI)           | POS           | 0000003  |

In this example, Dual Message Clearing System will create one file for endpoint 0000001, one file for endpoint 0000002, and one file for endpoint 0000003 after each specified clearing cycle cutoff.

The file created for endpoint 0000001 will contain Maestro and Cirrus ATM transactions destined for issuer account ranges 545555 and 547777. The file created for endpoint 0000002

will contain all Mastercard transactions destined for issuer account range 545555. The file created for endpoint 0000003 will contain Maestro point-of-sale (POS) transactions destined for issuer account range 547777.

An issuer could use this option to simulate the processing class concept by assigning one endpoint to Maestro and Cirrus ATM transactions, one endpoint to Maestro POS transactions, and one endpoint to Mastercard transactions, for each issuing account range.

## Clearing cycle options

Customers have multiple options from which they may choose to receive clearing files.

Each customer must receive data from all six cycles per day. In addition to the six primary clearing cycles, a seventh clearing cycle exists exclusively for Mexico RedMX domestic switching transactions. If a customer participates in the seventh cycle for the Mexico domestic service, they must receive clearing files in the seventh clearing. These customers will continue to receive the outbound files for other clearings for other activity.

Customers automatically receive clearing files at these default times, unless they contact Mastercard. Customers that want to change their clearing cycle cutoff times should contact their account manager or Mastercard Customer Implementation Specialist.

For a detailed overview of the clearing cycle times, refer to the [Clearing schedule](#).

**NOTE: The outbound delivery of the files of cycles one and two is extended by 1-3 hours on release implementation dates only. The files from cycles three through six will be delivered at the usual times. Release implementation dates occur four times a year and occur on a Friday of the release implementation month. Although the files of cycles one and two are delivered on a different calendar day from cycles three through six, Mastercard considers the delivery of all six cycles of files to occur in one processing day.**

## Merging of clearing information between cycles

New customers must participate in all clearing cycles.

Existing customers and processors may choose to receive clearing data less than six times per day. This results in the merging of their clearing activity across cycle boundaries.

When the customer's or processor's next delivery cycle is completed, the clearing file delivered will actually represent activity from two cycles, or even three cycles if two consecutive cycles have been skipped. In the following example, if a customer receives clearing data after cycles 1, 2, 5, and 6, the file delivered after cycle 5 will contain data from clearing cycles 3, 4, and 5.

**NOTE: Within the MTI-Function Code category, data will not necessarily be in ascending clearing cycle sequence. For example, cycle 5 First Presentments might precede cycle 4 First Presentments.**

For more information on clearing cycles, refer to the [Clearing schedule](#).

## Early reconciliation customer and non-early reconciliation processor example

The following table illustrates the differences of selecting receipt of early reconciliation messages when both processors have chosen cycles 1, 3, 4, and 6 as their delivery cycles.

### Early reconciliation customer and non-early reconciliation processor example

| IF the current cycle is... | AND both processors send in...                | Processors that choose early reconciliation files will receive...                                                        | Processors that do not choose early reconciliation files will receive...                                                                                     |
|----------------------------|-----------------------------------------------|--------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Cycle 1                    | First Presentment messages totaling USD 1,000 | Acknowledgment messages for the USD 1,000 in First Presentments when the Dual Message Clearing System processes the file | Acknowledgment messages for the USD 1,000 in First Presentments from cycle 1                                                                                 |
| Cycle 2                    | First Presentment messages totaling USD 2,000 | Acknowledgment messages for the USD 2,000 in First Presentments when the Dual Message Clearing System processes the file | Acknowledgment held for the next delivery cycle                                                                                                              |
| Cycle 3                    | First Presentment messages totaling USD 3,000 | Acknowledgment messages for the USD 3,000 in First Presentments when the Dual Message Clearing System processes the file | Acknowledgment messages for the USD 2,000 in First Presentments from cycle 2<br>Acknowledgment messages for the USD 3,000 in First Presentments from cycle 3 |
| Cycle 4                    | First Presentment messages totaling USD 4,000 | Acknowledgment messages for the USD 4,000 in First Presentments when the Dual Message Clearing System processes the file | Acknowledgment messages for the USD 4,000 in First Presentments from cycle 4                                                                                 |
| Cycle 5                    | First Presentment messages totaling USD 5,000 | Acknowledgment messages for the USD 5,000 in First Presentments when the Dual Message Clearing System processes the file | Acknowledgment held for the next delivery cycle                                                                                                              |

| IF the current cycle is... | AND both processors send in...                | Processors that choose early reconciliation files will receive...                                                        | Processors that do not choose early reconciliation files will receive...                                                                                         |
|----------------------------|-----------------------------------------------|--------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Cycle 6                    | First Presentment messages totaling USD 6,000 | Acknowledgment messages for the USD 6,000 in First Presentments when the Dual Message Clearing System processes the file | Acknowledgment messages for the USD 5,000 in First Presentments from cycle 5<br><br>Acknowledgment messages for the USD 6,000 in First Presentments from cycle 6 |

### Mastercard early reconciliation files supporting information

The sequence number returned by the Dual Message Clearing System in the T113 early reconciliation bulk file generated by Mastercard will match the sequence number sent by the customer in the corresponding customer-generated R111 Dual Message Clearing System Data bulk file for those customers electing receipt of the early reconciliation files. Mexico Domestic transactions for the seventh clearing is sent by customers under bulk type RSP1, and the Dual Message Clearing System will use the sequence number from the RSP1 bulk file for early reconciliation and send it under the Bulk File T113 bulk to customers.

The sequence of an IPM early reconciliation message physical file generated by Mastercard is similar to the sequence in the following table. Suppose that customer ID 004444, endpoint 1, processes for customer IDs 002222, 003333, 005555, and 006666. When processing for multiple customer IDs, the Dual Message Clearing System constructs the receiver's inbound file as shown in the following table.

### Example of sequencing of files generated by Mastercard

| MTI-Function Code | Description                  | Endpoint 1, to Customer ID (ICA) |
|-------------------|------------------------------|----------------------------------|
| 1644-697          | File Header                  | 004444                           |
| 1644-693          | Text Message                 | 002222                           |
| 1644-640          | Currency Update              | 002222                           |
| 1240-200          | First Presentment            | 002222                           |
| 1644-696          | Financial Detail Addendum    | 002222                           |
| 1240-282          | Second Presentment (Partial) | 002222                           |
| 1644-685          | Financial Position Detail    | 002222                           |
| 1644-698          | Settlement Position Detail   | 002222                           |

| MTI-Function Code | Description                                | Endpoint 1, to Customer ID (ICA) |
|-------------------|--------------------------------------------|----------------------------------|
| 1240-200          | First Presentment                          | 003333                           |
| 1644-603          | Retrieval Request                          | 003333                           |
| 1740-700          | Fee Collection (Retrieval Fee Billing)     | 003333                           |
| 1442-450          | First Chargeback: Full Amount              | 003333                           |
| 1240-205          | Second Presentment                         | 003333                           |
| 1442-451          | Arbitration Chargeback: Full Amount        | 003333                           |
| 1740-700          | Fee Collection (non-Retrieval Fee Billing) | 003333                           |
| 1644-685          | Financial Position Detail                  | 003333                           |
| 1644-695          | File Trailer                               | 004444                           |

Customers that participate in the Dual Message Clearing System early reconciliation experience duplicate file sequence numbers in acknowledgment reconciliation messages when a physical file contains more than 99 logical files. This is because PDS 0300 (Reconciled, File), subfield 4 (File Sequence Number), positions 24-25 (Sequence Number) is a two-position value, which means that submitting over 99 logical files causes the sequence to repeat. Furthermore, if a physical file exceeds 999 logical files, the customer will not receive early reconciliation for the physical file and could miss the preferred settlement cycle. To avoid undesired processing of early reconciliation files, Mastercard advises customers to limit the number of logical files to 99.

Customers can match the physical file sent to Mastercard with the early reconciliation file shown by the T113 Dual Message Clearing System early reconciliation file. The following table identifies the pairing of the early reconciliation files with the file sent by the customer.

### Early reconciliation files

| The customer should match the...                                                           | With the...                                                                                                                                    |
|--------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| T113 Dual Message Clearing System Early Reconciliation File received from Mastercard       | R111 (or RSP1 for Mexico Domestic transactions under the seventh clearing cycle) Dual Message Clearing System Data sent by the customer.       |
| T121 Test: Dual Message Clearing System Early Reconciliation File received from Mastercard | R119 (or RSP3 for Mexico Domestic transactions under the seventh clearing cycle) Test: Dual Message Clearing System Data sent by the customer. |

## Important Data Elements specific to Early Reconciliation

Some important data elements specific to early recognition are as follows:

- 1644/697 File Header: PDS 0105 Subfield 1 (File Type) (1–3) = 003 (Early Reconciliation file: Generated by Mastercard). \*Different for local processing systems.
- 1644/680 File Currency Summary & 1644/685 Settlement Currency Summary: PDS 0300 contains the PDS 0105 value submitted by the file originator in customer-generated files. This can be used by customers to reconcile data.
- DE 93 is the institution that has an agreement with Mastercard as being a principal member and has the financial authority to process transactions as an acquirer or issuer.
- DE 100 contains the Customer ID or Processor ID of the physically connected processing facility that receives a message.
- 1644/685 Settlement Currency Summary: Reconciled Settlement Activity (PDS 0359 [Reconciled Settlement Activity]) identifies in reconciliation messages the settlement activity to which the reconciliation totals pertain. Apart from other sub fields, it contains important values like Reconciliation Date, Reconciliation Cycle, Settlement Date, Settlement Cycle, which are important to members making prefunding to merchants and in regions where the settlement time frame is longer.

## Comparison of T112 and T113

The table provides a summary of important differences between the T112 and T113.

### T112 and T113 Comparison

|                      | <b>T112(Clearing Reconciliation File)</b>                                                                                                                               | <b>T113 (Early Reconciliation File)</b>                                                                                                                                 |

| File Structure       | IPM                                                                                                                                                                     | IPM (Same as T112)                                                                                                                                                      |

|                           | <b>T112(Clearing Reconciliation File)</b> | <b>T113 (Early Reconciliation File)</b> |
|---------------------------|-------------------------------------------|-----------------------------------------|
| Reconciliation Categories | As per the Message Type                   | As per the Message Type. (Same as T112) |

The Dual Message Clearing System does not duplicate the messages provided in the early reconciliation files when it creates the customer inbound clearing files at cycle cutoff times. The customer will receive the message only once. Reconciliation messages not selected in Early Reconciliation will be delivered within the customers' inbound file from Mastercard (T112) based on customer selection.

## Text messages used by the Dual Message Clearing System

These are general notes on text messages.

### Administrative IPM text messages

Dual Message Clearing System uses IPM text messages to:

- Transmit broadcast messages from the Dual Message Clearing System to all customers.
- Transmit text messages (such as No Data messages) from the Dual Message Clearing System to a customer.

This message type contains 1644 in the MTI and 693 in DE 24 (Function Code) to identify it as a text message.

### Broadcast text messages

The Dual Message Clearing System distributes broadcast text messages in every clearing cycle for the applicable period by the combination of customer or processor, endpoint, and card program identifier.

Because broadcast text messages may contain time-critical information, these text messages are not optional. The Dual Message Clearing System distributes them whether or not customers have financial activity or other clearing data in the next available delivery cycle based on options for the destination endpoint. If the Dual Message Clearing System has acknowledgment, notification, or error messages ready to send at the time of the broadcast message, the Dual Message Clearing System may include them in the same file as the broadcast message. However, even if no such messages are ready to be sent, the Dual Message Clearing System will send the broadcast message after the clearing cycle cutoff is complete.

### No Data text messages

If selected by the customer, the Dual Message Clearing System generates a No Data message when there is no clearing data activity for the specified customer ID for an entire clearing cycle.

The message text in DE 72 (Data Record) appears as follows: NO DATA FOR THIS MEMBER AND/OR ENDPOINT FOR THIS CLEARING.

The Dual Message Clearing System distributes No Data text messages by the combination of customer or processor endpoint and clearing cycle. The Dual Message Clearing System generates these messages only if the customer or processor chooses to receive them.

If the customer or processor does not choose to receive this No Data message and there is no data for that customer or endpoint, the customer or processor will not receive an empty dataset for specified clearing cycles. This No Data message also applies to the seventh clearing cycle for Mexico domestic switching transactions.

**NOTE: Mastercard recommends that customers using CONNECT:Direct choose to receive the No Data file.**

## Notification reconciliation messages created by the Dual Message Clearing System

The Dual Message Clearing System provides notification reconciliation messages for files sent to each customer based on the customer's profile options.

Notification reconciliation messages contain the Dual Message Clearing System-calculated totals for financial activity contained in files sent to each customer.

## acceptor

A person or entity that agrees to accept payment cards or devices bearing a particular brand or in respect to an agreement with the issuer. Also referred to as a merchant, ATM, bank, merchant ATM, or other entity authorized to accept brand transactions.

**Plural Form:** acceptors

## acceptance brand

Acceptance brands are Mastercard and other private label brands, such as cards specific to a particular department store or airline.

**Plural Form:** acceptance brands

## acquirer

A licensed Mastercard customer that acquires the data relating to a transaction from the acceptor and submits that data for authorization. The acquirer also supports clearing and settlement functions to exchange funds between the issuer and the acceptor. Also referred to as an acquiring bank, acquirer bank, merchant bank, or acquiring financial institution.

**Plural Form:** acquirers

## acquirer host

A term referring to customer host processing at the acquirer's location.

## advice message

A message that notifies a party of an action that has been taken, requiring no response.

**Plural Form:** advice messages

## advisement

A message that identifies the net settlement position of one or more ICA numbers (or customers) and is transmitted to the destination specified by the member Net Settlement Agreement (NSA) form.

**Plural Form:** advisements

## alternate issuer host

Alternate issuer authorization route used instead of the Stand-In Authorization; available in Europe region.

## Authorization

Real-time communication between acquirers and issuers to approve or decline the use of a Mastercard-branded card, access device, or account to conduct a transaction. Approval from issuers will create a financial obligation from the issuer to the acquirer (for a transaction that debits funds from a cardholder's account) or from the acquirer to the issuer (for a transaction that credits funds to a cardholder's account).

## authorization request

A request by an acquirer for issuer approval to complete a transaction involving a payment card.

**Plural Form:** authorization requests

## back-office process

Non-client-facing tasks that keep the business running and provide support for front-end operations.

## batch processing

A type of data processing operation and data communications transmission where related transactions are grouped together and transmitted for processing, usually by the same computer and under the same application; generally regarded as non-real-time data traffic comprising large files; type of data traffic where response time is not critical.

## cardholder

A cardholder is an authorized person to whom a payment card or a device payment has been issued. Also referred to as a consumer or account holder.

**Plural Form:** cardholders

## Clearing

Multiple clearing batch processes per day (that is, clearing cycles) determine and calculate processing costs, resulting in one net amount per acquirer and issuer per clearing cycle.

## customer

A financial institution or other entity that has been approved for participation in the payment scheme.

## Dual Message Authorization System

The Mastercard Dual Message Authorization System is a global real-time message processing system and is a component of the Mastercard Network. The Mastercard Network supports real-time authorization processing followed by batch reconciliation leading to settlement of funds between acquirers and issuers.

The Authorization System processing is integrated with the acquirer and issuer processing system communicates in real time to process authorization data to get an issuer decision.

Mastercard acquirers and issuers leverage the Authorization System to exchange financial transaction data captured at the point-of-interaction device to obtain an authorization decision.

The Authorization System consists of both hardware and software components. The physical computing infrastructure includes servers, routers, switches, and cabling. This hardware is configured with Mastercard's proprietary technology, which makes it a Mastercard interface processor (MIP) and is physically set up and connected with an acquirer or issuer processing system in their data centers.

**Plural Form:** Dual Message Authorization System

## Dual Message Clearing System

The Dual Message Clearing System, otherwise known as the Global Clearing Management System (GCMS), is a component of the Mastercard Network that provides a central mechanism for the exchange of offline financial clearing messages. All participants are both senders and receivers of clearing data.

**Plural Form:** Dual Message Clearing System

## echo

Data repeated back to the sender by the recipient to verify that it was received correctly.

## encryption

The process by which data is translated into secret code. Encryption is the most effective way to secure data. To read an encrypted file, the user must have access to a key or password that enables them to decrypt it.

## exception processing

A procedure for managing transactions that cannot be processed or which are interrupted.

## fraud

A deception deliberately practiced to secure unlawful gain.

## fraudulent transaction

A transaction effected using a cardholder's account number which is not engaged in or authorized by the cardholder. Such transactions are categorized as lost, stolen, not received, issued on a fraudulent application, counterfeit, fraudulent processing of transactions, account takeover (ATO), or other fraudulent conditions.

**Plural Form:** fraudulent transactions

## host

An intelligent processor or device that is connected to a network and satisfies the needs of remote users.

## Global Clearing Management System (GCMS)

Another term for the Dual Message Clearing System, the GCMS is a component of the Mastercard Network that provides a central mechanism for the exchange of offline financial clearing messages. All participants are both senders and receivers of clearing data.

**Plural Form:** Global Clearing Management System

**Abbreviation:** GCMS

## International Organization for Standardization (ISO)

The International Organization for Standardization (ISO) is a worldwide federation of national standards bodies from more than 160 countries, one from each member country. ISO is a non-governmental organization established in 1947 and based in Geneva. Its mission is to promote the development of standardization and related activities in the world with a view to facilitating the international exchange of goods and services, and to developing cooperation in the spheres of intellectual, scientific, technological and economic activity. ISO's work results in international agreements which are published as International Standards and other types of ISO deliverables.

## International Organization for Standardization 8583:1987

The international standard for bankcard-originated messages and interchange message specifications.

**Plural Form:** International Organization for Standardization (ISO) 8583:1987

**Abbreviation:** ISO 8583:1987

## International Organization for Standardization 8583:1993

The international standard for bankcard-originated messages and interchange message specifications.

**Plural Form:** International Organization for Standardization (ISO) 8583:1993

**Abbreviation:** ISO 8583:1993

## issuer

An issuer is a licensed Mastercard customer that issues cards or accounts and is responsible for approving or declining authorization requests. The issuer also bills cardholders and supports clearing and settlement functions to exchange funds between the cardholders account and the acquirer. Also referred to as an issuing bank, issuer bank, cardholder bank, or issuing financial institution.

**Plural Form:** issuers

## issuer host

A term referring to customer host processing at the issuer's location.

## Mastercard Network

The computer hardware and software operated by and on behalf of the Corporation for the routing, processing, and settlement of Transactions and PTA Transactions including, without limitation, the Mastercard Network, the Mastercard ATM Network, the Dual Message System, the Single Message System, the Global Clearing Management System (GCMS), the Settlement Account Management (SAM) system, and the China Switch system.

**Plural Form:** Mastercard Network

## Mastercard interface processor (MIP)

Front-end communications processor placed on-site at a Mastercard customer's facility or at a processor or hub site. The MIP provides access to the Mastercard Network.

**Plural Form:** Mastercard interface processors

**Abbreviation:** MIP

## Network

See Switch.

## Network Enablement Partner

A service provider that has a direct agreement with Mastercard and performs certain functions on behalf of one or more customers.

**Plural Form:** Network Enablement Partners

## primary issuer

Banking primary issuer, also known as an issuing bank or card issuer, is a financial institution that provides a cardholder with a payment card.

## processor

A processor provides authorization, clearing, or settlement services on behalf of a customer. Also referred to as a third-party processor or payment processor.

**Plural Form:** processors

## reason code

Also known as message reason code. For each chargeback, an issuer selects and submits a numeric reason code. This code assists the merchant and acquirer to diagnose errors and improves the customer experience.

**Plural Form:** reason codes

## receipt

A hard copy document recording a transaction that took place at the point of interaction, with a description that usually includes the date, merchant name/location, primary account number, amount, and reference number.

## reconciliation

Process by which settlement payments are balanced against amounts and totals provided by the association's processing systems.

## request

A message originated an interactive series of messages.

**Plural Form:** requests

## response code

Response codes indicate the disposition of a previous message or an action taken as a result of receipt of a previous message.

**Plural Form:** response codes

## response time

The elapsed time between the generation of the last character of a message at a terminal and the receipt of the first character of the reply. It includes terminal delay and network delay.

**Plural Form:** response times

## reversal message

A message relating to a reversal.

**Plural Form:** reversal messages

## service provider

A person or entity that is registered with Mastercard by a customer to perform services related to the customers issuing or an acquiring activity.

**Plural Form:** service providers

## Settlement

Aggregates financial positions from all clearing settlement information into one overall daily net settlement amount for each acquirer and issuer. Creating and distributing advisements (notifications) to acquirers and issuers along with Transfer Funds Orders to Settlement Banks for amounts to be transferred to or collected from acquirers and issuers.

## Single Message System

A global real-time message processing system and is a component of the Mastercard Network. The Mastercard Network supports real-time authorization processing followed by batch reconciliation leading to settlement of funds between acquirers and issuers.

Mastercard acquirers and issuers leverage the Single Message System to exchange financial transaction data captured at the point-of-interaction device. The Single Message System, through a single financial message interaction, fulfills authorization processing, reconciliation, and settlement functions.

The Single Message System consists of both hardware and software components. The physical computing infrastructure includes servers, routers, switches, and cabling. This hardware is configured with Mastercard's proprietary technology, which makes it a Mastercard interface processor (MIP) and is physically set up and connected with an acquirer or issuer processing system in their data centers.

**Plural Form:** Single Message System

**Abbreviation:** Single Message System

## Stand-In Authorization

Authorization processing provided by Mastercard for online issuers that are unavailable or that cannot be reached.

## Switch

The computer hardware and software operated by and on behalf of a payment scheme for the routing, processing, and settlement of transactions bearing the payment scheme brand in accordance with such payment scheme's rules and regulations, and which may also be used to route transactions to another payment scheme's switch or to route, process, and settle non-branded (also called private label) transactions as agreed by the participating parties. Also called a Network.

**Plural Form:** Switches

## Dual Message Switch

A Switch used to process transactions for which authorization and clearing occurs separately in a dual message format. The Mastercard Dual Message System (both authorization and clearing) is a Dual Message Switch.

## Single Message Switch

A Switch used to process transactions for which authorization and clearing occurs in a single message format. The Mastercard Single Message System is a Single Message Switch.

## transfer agent assignment (TAA)

A combination of the customer's transfer agent and the customer bank account number.

**Abbreviation:** TAA

## X-Code, X-Code Processing

A system that performs issuer functions by receiving and responding to authorization requests at the acquirer Mastercard interface processor (MIP).

## Appendix K Data element listing

This table is a listing of all the data elements in numerical order.

The lengths listed in the attribute column are ISO-defined.

### Data element listing

| Number | Name                                | Attribute          |
|--------|-------------------------------------|--------------------|
| -      | Message Type Identifier (MTI)       | n-4                |
| -      | Bit Map, Primary                    | b-8                |
| 1      | Bit Map, Secondary                  | b-8                |
| 2      | Primary Account Number (PAN)        | n...19; LLVAR      |
| 3      | Processing Code                     | n-6                |
| 4      | Amount, Transaction                 | n-12               |
| 5      | Amount, Reconciliation              | n-12               |
| 6      | Amount, Cardholder Billing          | n-12               |
| 9      | Conversion Rate, Reconciliation     | n-8                |
| 10     | Conversion Rate, Cardholder Billing | n-8                |
| 12     | Date and Time, Local Transaction    | n-12; YYMMDDhhmmss |
| 14     | Date, Expiration                    | n-4; YYMM          |
| 22     | Point of Service Data Code          | an-12              |
| 23     | Card Sequence Number                | n-3                |
| 24     | Function Code                       | n-3                |

# Notices

Following are policies pertaining to proprietary rights, trademarks, translations, and details about the availability of additional information online.

## Proprietary Rights

The information contained in this document is proprietary and confidential to Mastercard International Incorporated, one or more of its affiliated entities (collectively "Mastercard"), or both.

This material may not be duplicated, published, or disclosed, in whole or in part, without the prior written permission of Mastercard.

## Trademarks

Trademark notices and symbols used in this document reflect the registration status of Mastercard trademarks in the United States. Consult with the Global Customer Service team or the Mastercard Law Department for the registration status of particular product, program, or service names outside the United States.

All third-party product and service names are trademarks or registered trademarks of their respective owners.

EMV<sup>®</sup> is a registered trademark of EMVCo LLC in the United States and other countries. For more information, see <http://www.emvco.com>.

## Disclaimer

Mastercard makes no representations or warranties of any kind, express or implied, with respect to the contents of this document. Without limitation, Mastercard specifically disclaims all representations and warranties with respect to this document and any intellectual property rights subsisting therein or any part thereof, including but not limited to any and all implied warranties of title, non-infringement, or suitability for any purpose (whether or not Mastercard has been advised, has reason to know, or is otherwise in fact aware of any information) or achievement of any particular result.

## Translation

A translation of any Mastercard manual, bulletin, release, or other Mastercard document into a language other than English is intended solely as a convenience to Mastercard customers. Mastercard provides any translated document to its customers "AS IS" and makes no representations or warranties of any kind with respect to the translated document, including, but not limited to, its accuracy or reliability. In no event shall Mastercard be liable for any damages resulting from reliance on any translated document. The English version of any Mastercard document will take precedence over any translated version in any legal proceeding.

## Information Available Online

Mastercard provides details about the standards used for this document, including times expressed, language use, and contact information, on the Technical Resource Center (TRC).
